## CHAPTER - 5 <br> STUDY OF COINTEGRATION BETWEEN RUPEE / NEPALESE RUPEE EXCHANGE RATE AND RELATIVE PRICE LEVEL

### 5.1 Introduction:

Rupee/ Nepalese Rupee exchange rate $\left(\mathrm{e}_{\mathrm{t}}\right)$ and relative price level $\left(\mathrm{p}_{\mathrm{t}}\right)$ series are nonstationary and both the series are $\mathrm{I}(1)$. Since both the series possess the same order of integrability, the possibility of cointegration between these series exists. The study of the cointegration between $e_{t}$ and $p_{t}$ is important in view of the fact that the existence of such cointegration implies long-run relationship between exchange rate and relative price level of the two countries concerned. In that case, exchange rates quoted between the currencies will be in parity with the relative prices prevailing at different time sequences of the period of study. This implies, on the other hand, that exchange rates quoted for the currencies are related to and in parity with the relative purchasing power of the currencies over the study-period. Consequently, 'Purchasing Power Parity Doctrine' becomes a valid phenomenon in the determination of exchange rate of currencies of the countries concerned (viz, India and Nepal). It is, therefore, pertinent to examine if these variables ( $e_{t}$ and $p_{t}$ ) are cointegrated. The study in this chapter is devoted to address this issue.

### 5.2 Johansen Cointegration Test

The Johansen Cointegration Tests are used to examine if Rupee/ Nepalese Rupee exchange rate $\left(e_{t}\right)$ and the relative price level $\left(p_{t}\right)$ series are cointegrated at level over the period 1976:1-2006:1. The results of such tests are being presented through the Table5.1.

## Table-5.1

Results of Johansen Cointegration Tests for
$e_{t}$ and $p_{t}$ at level [Period 1976:1-2006:1]
Trend Assumption: Linear Deterministic Trend (Restricted)
Lag Intervals (in first Difference): 1-4

| I Unrestricted Cointegration Rank $\lambda_{\text {trace }}$ Test Variables Involved: $e_{t}$ and $p_{t}$ at Level |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Null | Alternative | Eigen | Trace | Critical | values |
| Hypothesis | Hypothesis | Value | Statistics ( $\lambda_{\text {trace }}$ ) | 5\% | 1\% |
| $\mathrm{r}=0$ | $r>0$ | 0.082 | 14.529 | 25.32 | 30.45 |
| $\mathrm{r} \leq 1$ | $\mathrm{r} \geq 1$ | 0.039 | 4.641 | 12.25 | 16.26 |
| II Unrestricted Cointegration Rank $\lambda_{\max }$ Test Variables Involved: $e_{t}$ and $p_{t}$ at Level |  |  |  |  |  |
| Null Hypothesis | Alternative Hypothesis | Eigen <br> Value | Maximum Eigen Statistics ( $\lambda_{\text {max }}$ ) | Critica $5 \%$ | Values <br> 1\% |
| $\mathrm{r}=0$ | $\mathrm{r}=1$ | 0.082 | 9.888 | 18.96 | 23.65 |
| $\mathrm{r} \leq 1$ | $\mathrm{r}=2$ | 0.039 | 4.641 | 12.25 | 16.26 |

### 5.3 Findings From the Table 5.1

It is observed from the Table 5.1 that
i. for the null-hypothesis $\mathrm{r}=0$ against the alternative hypothesis $\mathrm{r}>0, \lambda_{\text {trace }}(0)=14.529$ is lower than the corresponding $5 \%$ and $1 \%$ critical values. Therefore, the nullhypothesis of 'no cointegrating' relation cannot be rejected even at $5 \%$ level.
ii. for the null-hypothesis $r \leq 1$ against the alternative hypothesis $r>1$, the value of $\lambda_{\text {trace }}$ (1) statistic is 4.641 which is lower than $1 \%$ and $5 \%$ critical values. So the null hypothesis of $\mathrm{r} \leq 1$ cannot be rejected even at $5 \%$ level.
iii. for the null hypothesis $\mathrm{r}=0$ against the alternative hypothesis $\mathrm{r}=1$ under $\lambda_{\max }$ test, $\lambda_{\max }(1,0)$ value is 9.888 . It is lower than the corresponding $5 \%$ and $1 \%$ critical values. It implies that the null hypothesis of 'no cointegration' cannot be rejected at even $5 \%$ level.
iv. for the null hypothesis $\mathrm{r}=1$ against the alternative hypothesis $\mathrm{r}=2$ under $\lambda_{\max }$ test, $\lambda_{\max }(1,2)=4.641$ falls short of the corresponding critical values at $5 \%$ and $1 \%$ levels. Consequently, the null hypothesis of 'no cointegration' between the variables appears to be accepted at even $5 \%$ level.

### 5.4 Overview of the Findings of Cointegration Study and Economic Implications

It is observed from the findings in Section 5.3 that
i. there does not exist any 'cointegration' between Rupee/Nepalese Rupee exchange $\operatorname{rate}\left(\mathrm{e}_{\mathrm{t}}\right)$ and the relative price level $\left(\mathrm{p}_{\mathrm{t}}\right)$ at level over the period of study (1976:12006:1).
ii. though both of $e_{t}$ and $p_{t}$ are $I(1)$, these are not $C I(I, 0)$.

The absence of cointegration between exchange rate $\left(\mathrm{e}_{\mathrm{t}}\right)$ and relative price level $\left(\mathrm{p}_{\mathrm{t}}\right)$ at level bears some important economic implications. The 'non-cointegration' between $e_{t}$ and $p_{t}$ implies that the exchange rates quoted between Indian and Nepalese Currency were not related to the relative purchasing power of the currencies over the period of study. Consequently, there did not exist any long-run relationship between exchange rates quoted in international trade and the relative price levels in these countries.

Study of cointegration enquires into the existence of equilibrium relationship postulated by the economic theory. In the present context the economic theory refers to the 'Purchasing Power Parity Theory' which stresses upon the long-run relationship between exchange rate and relative purchasing power of currencies concerned. Under this theory exchange rate, in the long-run, establishes, the law of one price (LOOP).

However, the absence of cointegration between $\mathrm{e}_{\mathrm{t}}$ and $\mathrm{p}_{\mathrm{t}}$, as found in section 5.3, fails to testify for the validity of the 'Purchasing Power Parity Doctrine' over the period of study concerned. It, therefore, appears that the Rupee/ Nepalese Rupee exchange rates,
prevailing over the period of study, were largely determined by some factors other than contemporary relative price levels.

### 5.5 Limitations of Study with the Historical Dataset (Covering the period 1976:1-2006:1)

Lucas (1976) has pointed out that econometric relationships change over time following changes in economic policies, social set-ups, administrative decisions, management considerations, political liabilities and institutional opportunities etc. Thus multiforced changes affect the behaviour of macroeconomic variables leading to changes in their relations as a consequence. Thus historical dataset embodies such varying economic relations. Consequently, the econometric relations among the variables estimated with the historical dataset fail to represent the true econometric relations among the variables concerned.

The historical dataset used in this study covers a period of about thirty-one years (1976:12006:1). This period is marked by spectacular changes in economic-social-administrative-political fronts. In this period fixed exchange rate system gave away for 'crawling peg' system which was finally replaced by 'flexible exchange rate' system. Thus exchange rate system finally became free from government intervention and varied over time following variations in market forces. Within this period, era of liberalization dawned and globalization was welcome in the realm of trade. Bilateral and multi-lateral trade expansion took place among the South Asian Countries. SAARC was established and consequently both India and Nepal took important steps in bringing forth expansion of trade. Thus both the countries experienced changes in economic-social-political fronts and consequently economic relations among variables also underwent changes.

It may also be noted that these changes do not occur everyday. Changes in economic relations occur and continue for some time. Then again such relations change after the
passage of some time. Such changes in relations embody 'structural changes' by nature. Consequently, historical dataset is marked by the presence of 'structural changes'.

In the historical dataset (1976:1-2006:1) used in our study is found to contain two subperiods giving forth two distinct relations between exchange rate $\left(\mathrm{e}_{\mathrm{t}}\right)$ and relative price level $\left(\mathrm{p}_{\mathrm{t}}\right)$. The first sub period ranges from 1976:1 to $1993: 1$ and the second sub period extends from 1993:2 to 2006:1.

These two sub periods have been identified through the 'Chow Tests'. However, the exact period i.e, the coverage of the each of the sub-periods has been identified through laborious 'trial and error' methods. Identification of the end of the first sub-period and the beginning of the second sub period involved laborious econometric estimations. The justifications of such identifications becomes evident from the econometric findings presented in subsequent chapters.

### 5.6 Stationarity of $e_{t}$ and $p_{t}$ in the Sub-period 1976:1-1993:1: ADF Unit Root Test

The stationarity of $e_{t}$ and $p_{t}$ in the sub-period 1976:1-1993:1 has been examined through
i. the ADF Unit Root Test, and
ii. the Correlogram Study.

The results of the ADF Unit Root Tests on $e_{t}$ and $p_{t}$ at level and at first difference have been presented through the Tables 5.2 and 5.3 below.

Table: 5.2
Results of the ADF Unit Root Tests for $\mathbf{e}_{\mathbf{t}}$ and $p_{\mathbf{t}}$ at Level
(Sub-period: 1976:1-1993:1)

| Variable | Null Hypothesis | Lag* | ADF <br> Test <br> Stat. | Prob. | Mac-Kinnon Critical Value** |  |  |

|  | $\mathrm{p}_{\mathrm{t}}$ has unit root Exogenous: None | 1 | -8.407 | 0.000 | -2.600 | -1.946 | -1.613 |

**MacKinnon (1996) one-sided p-values. *Based on SIC, Max Lag $=10$

### 5.7 Findings From The Tables 5.2-5.3

(A) The Tables 5.2 shows that
i. the ADF test statistic for $e_{t}$ with intercept term as well as that for $e_{t}$ with 'intercept and linear trend term in the maintained regression equations fall short of critical values even at $10 \%$ level.
ii. the ADF test statistic for $\mathrm{e}_{\mathrm{t}}$ with 'no intercept term and linear trend' term in the maintained regression equation also falls short of the critical values even at $10 \%$ level.

All these findings indicate that $\mathrm{e}_{\mathrm{t}}$ is 'non-stationary' in the period 1976:1-1993:1.
(B) The Table 5.2 further shows that
i. the ADF test statistics for $\mathrm{p}_{\mathrm{t}}$ with 'intercept' and without 'intercept as well as linear trend' in the maintained regression equations are lower than the corresponding critical values even at $10 \%$ level.
ii. the ADF test statistic for $\mathrm{p}_{\mathrm{t}}$ with intercept and linear trend term in the maintained regression equation exceeds $1 \%$ critical values.

These findings indicate contradictory status regarding stationarity of $\mathrm{p}_{\mathrm{t}}$. In order to ascertain its stationarity, study of its correlogram becomes necessary.
(C) The Table 5.3 shows that
a. the ADF test statistic for $\mathrm{De}_{\mathrm{t}}$ (i.e. $\mathrm{e}_{\mathrm{t}}$ at first difference) with intercept or 'with intercept as well as linear trend' or 'without intercept and linear trend' term in the maintained regression equations exceed the critical values even at $1 \%$ level.
b. the ADF test statistic for $\mathrm{Dp}_{\mathrm{t}}$ (i.e. $\mathrm{p}_{\mathrm{t}}$ at first difference) exceed the critical values even at $1 \%$ level when the maintained regression equations are estimated with 'intercept only' or 'with intercept and linear trend term' or without 'intercept and linear trend term'.

These findings indicate that
i. both $\mathrm{De}_{\mathrm{t}}$ and $\mathrm{Dp}_{\mathrm{t}}$ are stationary even at $1 \%$ level, and therefore,
ii. $\quad e_{t} \sim I(1)$ and $p_{t} \sim I(1)$.

### 5.8 Stationarity of $e_{t}$ and $p_{t}$ in the Sub-period 1976:1-1993:1: Correlogram Study

The stationarity of $e_{t}$ and $p_{t}$ over the sub-period 1976:1-1993:1 has been examined through the study of their correlograms. The correlogram for $\mathrm{e}_{\mathrm{t}}$ at level and at first difference for this sub-period are given by the Figures 5.1-5.2. The correlograms for $p_{t}$ at level and at first difference for this sub-period are being presented through the Figures 5.3-5.4.

### 5.9 Findings From the Correlogram Study (Sub-period: 1976:1-1993:1)

(A) It is observed from the Figures 5.1-5.2 that
i. the $A C F$ for $\cdot \mathrm{e}_{\mathrm{t}}$ at level displays a long dying out pattern of spikes.
ii. the $P A C F$ for $\mathrm{e}_{\mathrm{t}}$ at level contains a singular significant spike at lag one.
iii. the $A C F$ for $\mathrm{e}_{\mathrm{t}}$ at first difference is marked by the absence of any dying out pattern of spikes.
iv. the $P A C F$ for $\mathrm{e}_{\mathrm{t}}$ at first difference contains no singularly significant spike at lag one.

All these observations confirm that
i. $\quad e_{t}$ at level in the sub-period 1976:1-1993:1 is non-stationary.
ii. $\quad e_{\mathrm{t}}$ attains stationarity upon first differencing over the sub-period 1976:1-1993:1.
(B) The Figures 5.3-5.4 show that
i. the $A C F$ of $\mathrm{p}_{\mathrm{t}}$ at level over the sub-period 1976:1-1993:1 is marked by the presence of a long dying out pattern of spikes.
ii. the $P A C F$ of $\mathrm{p}_{\mathrm{t}}$ at level over the sub-period 1976:1-1993:1 contains unique significant spike at lag one.
iii. the $A C F$ of $\mathrm{p}_{\mathrm{t}}$ at first difference exhibits no long dying out pattern of spikes.
iv. the PACF of $\mathrm{p}_{\mathrm{t}}$ at first difference is marked by the absence of any singularly significant spike at lag one.

These features of the correlograms of $\mathrm{p}_{\mathrm{t}}$ at level and at first difference indicate that
i. $\quad p_{t}$ is non-stationary at level, and
ii. $\quad p_{t}$ is stationary at first difference over the sub-period 1976:1-1993:1.

### 5.10 Review of the Findings on Stationarity of $e_{t}$ and $p_{t}$ Over the Sub-period 1976:1-1993:1

The Finding in Sections 5.7-5.9 confirm that over the sub-period 1976:1-1993:1
i. both $e_{t}$ and $p_{t}$ are non-stationary at level.
ii. both $e_{t}$ and $p_{t}$ attain stationarity upon first differencing, and, therefore,
iii. $\quad e_{t} \sim I(1)$ and $p_{t} \sim I(1)$.

### 5.11 Stationarity of $e_{t}$ and $p_{t}$ in the Sub-period 1993:2-2006:1: ADF Unit Root Tests

Stationarity of $e_{t}$ and $p_{t}$ in the sub-period 1993:2-2006:1 has been examined through ADF unit root tests. Results of such tests for $\mathrm{e}_{\mathrm{t}}$ and $\mathrm{p}_{\mathrm{t}}$ at level and at first difference are being presented through the Tables 5.4-5.5.

Table 5.4
Results of ADF Unit Root Tests for $\mathbf{e}_{t}$ and $p_{t}$ at Level:
[Sub-period: 1993:2-2006:1]

| Variable | Hypothesis | Lag* | ADF <br> Test <br> Stat. | Prob. | Mac-Kinnon Critical Value** |  |  |

|  | $\mathrm{p}_{\mathrm{t}}$ has unit root Exogenous: None | 6 | -1.067 | 0.254 | -2.617 | -1.948 | -1.612 |

**MacKinnon (1996) one-sided p-values.*Based on SIC, Max Lag = 10

Table 5.5
Results of ADF Unit Root Tests for $\mathbf{e}_{\mathbf{t}}$ and $\mathbf{p}_{\boldsymbol{t}}$ at First Difference:
[Sub-period: 1993:2-2006:1]

| Variable | Null Hypothesis | Lag* | ADF <br> Test <br> Stat. | Prob. | Mac-Kinnon Critical Value** |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | 1\% | 5\% | 10\% |
| De ${ }_{\text {t }}$ | De $\mathrm{t}_{\mathrm{t}}$ has unit root Exogenous: Constant | 1 | -8.977 | 0.000 | -3.571 | -2.922 | -2.599 |
|  | De $\mathrm{e}_{\mathrm{t}}$ has unit root Exogenous: Intercept and Linear Trend | 1 | -8.892 | 0.000 | -4.157 | -3.504 | -3.182 |
|  | De ${ }_{\mathrm{t}}$ has unit root Exogenous: None | 1 | -8.938 | 0.000 | -2.616 | -1.948 | -1.612 |
| $D p_{t}$ | $D p_{t}$ has unit root Exogenous: Constant | 5 | -4.646 | 0.0005 | -3.585 | -2.928 | -2.602 |
|  | $\mathrm{Dp}_{\mathrm{t}}$ has unit root Exogenous: Intercept and Linear Trend | 5 | -4.621 | 0.003 | -4.176 | -3.513 | -3.187 |
|  | $\mathrm{Dp}_{\mathrm{t}}$ has unit root <br> Exogenous: None | 5 | -4.700 | 0.000 | -2.617 | -1.948 | -1.612 |

**MacKinnon (1996) one-sided p-values. *Based on SIC, Max Lag = 10

### 5.12 Findings From the Table 5.4-5.5

(A) Tables 5.4 and 5.5 show that
i. the ADF Test Statistics for $\mathrm{e}_{\mathrm{t}}$ at level fall short of the critical values even at $10 \%$ level when the maintained regression equations are estimated with an intercept term only or with an intercept term along with a linear trend or without an intercept term as well as a linear trend.
ii. the ADF Test Statistics for $D e_{t}$ (i.e. $e_{t}$ at first difference) exceed the critical values even at $1 \%$ level when the maintained regression equations are estimated with an intercept or with an intercept along with a linear trend or without any intercept and linear trend.

These findings indicate that
a. $e_{t}$ is non-stationary at level even at $10 \%$ level of significance, and
b. De $e_{t}$ (i.e. $e_{t}$ upon first differencing) is stationary even at $1 \%$ level.
(B) It is further observed from the Tables that
i. the ADF test statistics for $\mathrm{p}_{\mathrm{t}}$ at level are lower than the corresponding critical values even at $10 \%$ level when estimated regression equations contain an intercept term or an intercept term together with a linear trend or without an intercept term and a time trend.
ii. the ADF test statistic for $\mathrm{D}_{\mathrm{t}}$ (i.e. $\mathrm{p}_{\mathrm{t}}$ at first difference) exceed the corresponding critical values at $1 \%$ level when maintained regression equations are estimated with an intercept term or with an intercept term together with a linear trend or without any intercept term and a linear trend.

These findings indicate that in the sub-period 1993:2-2006:1
i. $\quad \mathrm{p}_{\mathrm{t}}$ is non-stationary at level, and
ii. $\quad p_{t}$ attains stationarity upon first differencing such that $D p_{t}$ is stationary at level even at $1 \%$ level.

### 5.13 Stationarity of $e_{t}$ and $p_{t}$ in the Sub-period 1993:2-2006:1: Correlogram Study

Stationarity of $e_{t}$ and $p_{t}$ in the sub-period 1993:2-2006:1 has also been examined through the study of their respective correlograms. The correlograms of $\mathrm{e}_{\mathrm{t}}$ at level and at first difference are being presented through the Figures 5.5-5.6. Moreover, Figures 5.7 and 5.8 present the correlograms of $\mathrm{p}_{\mathrm{t}}$ at level and at first difference respectively.

Figure 5.8
Correlogram of Relative Price Level（ $\mathbf{p}_{\mathbf{t}}$ ）at First Difference
［Sub－Period：1993：2－2006：1］

### 5.14 Findings From the Correlogram Study (Sub-Period: 1993:2-2006:1)

(A) It is observed from the figures 5.5-5.6 that in the Sub-Period: 1993:2-2006:1
i. the $A C F$ of $\mathrm{e}_{\mathrm{t}}$ at level exhibits a long dying out pattern of spikes extending beyond $20^{\text {th }}$ lag.
ii. the PACF of $\mathrm{e}_{\mathrm{t}}$ at level exhibits the presence of a 'unique' significant spike at lag one.
iii. the $A C F$ of $\mathrm{De}_{\mathrm{t}}$ (i.e. $\mathrm{e}_{\mathrm{t}}$ at first difference) is marked by the absence of a dying out ladder like pattern of spikes.
iv. the $P A C F$ of $\mathrm{De}_{\mathrm{t}}$ contains no singularly significant spike at lag one.

All these features of the correlograms of $\mathrm{e}_{\mathrm{t}}$ at level and first difference confirm the findings of the ADF unit root tests that over the period 1993:2-2006:1
i. $\quad \mathrm{e}_{\mathrm{t}}$ is non-stationary at level, and
ii. $\quad D e_{\mathrm{t}}$ is stationary at level i.e, $\mathrm{e}_{\mathrm{t}}$ attains stationarity upon first differencing.
(B) The Figures 5.7 and 5.8 show that in the sub-period 1993:2-2006:1
i. the $A C F$ of $\mathrm{p}_{\mathrm{t}}$ at level contains a long dying out pattern of spikes extending beyond the $20^{\text {th }}$ lag.
ii. the $P A C F$ of $\mathrm{p}_{\mathrm{t}}$ at level is devoid of any such pattern and any singularly significant spike at lag one.
iii. the $A C F$ of $\mathrm{Dp}_{\mathrm{t}}$ (i.e $\mathrm{p}_{\mathrm{t}}$ upon first difference) exhibits no dying out pattern of spikes.
iv. the $P A C F$ of $\mathrm{De}_{\mathrm{t}}$ is marked by the absence of any unique significant spike at lag one.

All these features of the correlograms of $\mathrm{p}_{\mathrm{t}}$ at level and at first difference testify that over the sub-period 1993:2-2006:1
a. $\mathrm{p}_{\mathrm{t}}$ at level is non-stationary, and
b. $D p_{t}$ is stationary at level and, therefore, $p_{t}$ attains stationarity upon first differencing.

### 5.15 Review of Findings on Stationarity and Integrability of $e_{t}$ and $p_{t}$ over the Sub-

 Period 1993:2-2006:1The findings on Stationarity and Integrability of $e_{t}$ and $p_{t}$ over the sub-period 1993:22006:1 in the sections 5.12 through 5.14 confirm that
i. $\quad e_{t}$ and $p_{t}$ at level are non-stationary.
ii. $\quad e_{t}$ and $p_{t}$ are stationary upon first differencing, and
iii. $\quad e_{t} \sim I(1)$ and $p_{t} \sim I(1)$.

### 5.16 Summary of the Findings and Economic Implications

The findings in this Chapter (Chapter 5) over the subsections 5.7-5.14 confirm that
i. $\quad \mathrm{e}_{\mathrm{t}} \sim \mathrm{I}(1)$ and $\mathrm{p}_{\mathrm{t}} \sim \mathrm{I}(1)$ over the sub-period 1976:1-1993:1, and
ii. $\quad \mathrm{e}_{\mathrm{t}} \sim \mathrm{I}(1)$ and $\mathrm{p}_{\mathrm{t}} \sim \mathrm{I}(1)$ over the sub-period 1993:2-2006:1.

In both the sub-periods, $e_{t}$ and $p_{t}$ are non-stationary while both of them possess the same order of integrability. These are integrated of order one. This indicates that there exist a scope of enquiring into the existence of long-run relationship between these variables in both the sub-periods. Consequently, the study of cointegration between $e_{t}$ and $p_{t}$ is theoretically justified in both the sub-periods. The cointegration between $e_{t}$ and $p_{t}$, if established in any of the sub-periods, would support the doctrine of 'Purchasing Power Parity' for the quoted exchange rates between the currencies of India and Nepal in that sub-period. The study in the next chapter is devoted to address this issue.
