

List of tables

1. Some legume-based traditional foods of India
2. Approximate a_w -values for growth of selected pathogens in food
3. Approximate pH values permitting the growth of selected pathogens in food
4. Approximate temperature values permitting the growth of selected foodborne pathogens
5. Sampling of legume-based food products
6. Collection of samples at different stages of processing
7. Variables and their levels for the experimental design
8. CCRD arrangement for soaking of blackgram
9. Variables and their levels for the experimental design
10. CCRD for mechanized drying of wadi
11. Sensory score card for wadi
12. Sensory score card for kinema
13. Sorption isotherm models for fitting experimental data
14. Moisture content, pH, a_w and microbial load of market samples of some legume-based foods
15. Confirmation of the presumptive *Bacillus cereus* s.l. strains grown on BCSA plates
16. Confirmation of the presumptive *Staphylococcus aureus* strains grown on BPA plates
17. Confirmation of the presumptive Enterobacteriaceae strains grown on TSA-VRBGA plates
18. Moisture content, pH, a_w and microbial load in sattoo at different processing stages
19. Moisture content, pH, a_w and microbial load in idli at different processing stages
20. Moisture content, pH, a_w and microbial load in wadi at different processing stages
21. RFO content in blackgram soaked under different experimental conditions
22. Estimated regression coefficients in terms of coded and uncoded units for RSM analysis of total RFO content in soaked beans
23. Sensory scores and a_w of wadi dried under different experimental conditions
24. Sensory scores of wadi dried under different experimental conditions
25. Estimated regression coefficients in terms of coded and uncoded units for RSM analysis of OAA
26. Estimated regression coefficients in terms of coded and uncoded units for RSM analysis of a_w
27. Moisture content, pH, a_w and microbial load of sun dried and dehumidifier dried wadi
28. Changes in titratable acidity, pH, a_w and TAMB as influenced by LAB during the laboratory preparation of idli
29. Influence of LAB on foodborne bacterial pathogens in a challenge study during preparation of idli

30. Changes in titratable acidity, pH, a_w and TAMB as influenced by LAB during mechanized drying of wadi
31. Influence of LAB on foodborne bacterial pathogens in a challenge study during mechanized drying of wadi
32. Changes in titratable acidity, pH, a_w and TAMB as influenced by LAB during storage of wadi at 25°C
33. Antibacterial activity of the LAB isolates determined by agar spot test
34. Determination of the nature of active principles in concentrated culture supernatants
35. Antagonistic activity of the neutralized culture supernatants of *Lactococcus lactis* isolates from wadi against the bacterial pathogens
36. The influence of added NaCl concentration in cooked soybeans on pH, a_w , viable cell count, proteolytic activity and sensory score after *Bacillus subtilis* (*Bs*)-fermentation at 37°C for 48 h to produce kinema
37. Influence of NaCl on functional microorganism (*Bs*) and foodborne bacterial pathogens in a challenge study during fermentation of soybeans to produce kinema
38. Sensory and physico-chemical characteristics of kinema stored at 20°C as influenced by salt and storage period
39. Parameter values for moisture adsorption and desorption of kinema at the three different temperatures studied
40. Properties of sorbed water in kinema
41. Free energy changes during adsorption and desorption processes of kinema at different temperatures
42. Equilibrium spreading pressures for kinema at different moisture content and temperature
43. Sorption ranges, constants, coefficient of determination (r^2) and %*rms* values of different sorption models at different temperatures for wadi
44. Properties of sorbed water in wadi
