# CHAPTER 7

# VECTOR AUTOREGRESSIVE MODEL

#### 7.1 Vector Autoregressive Model

We have sought to enquire into the interrelationship between government expenditure & government revenue in all chosen countries by establishing a structural model of revenues and expenditures. For this purpose, we have applied the Vector Autoregession Model. This model has desirable property that it treats all variables symmetrically. In our analysis, we have taken two important macroeconomic variables, namely, government expenditure & government revenue. Both these variables are endogeneous in the VAR system.

The model of VAR for government expenditure & government revenue consists of the following equations.

\_\_\_\_

$$\Delta R_{t} = c_{1} + \sum_{i=1}^{k} a_{1i} \Delta R_{t-i} + \sum_{i=1}^{k} b_{1i} \Delta E_{t-i} + e_{1} \dots \dots (8)$$
$$\Delta E_{t} = c_{2} + \sum_{i=1}^{k} a_{2i} \Delta E_{t-i} + \sum_{i=1}^{k} b_{2i} \Delta R_{t-i} + e_{2} \dots \dots (9)$$

\_\_\_

where a<sub>1i</sub>, b<sub>1i</sub> and c<sub>i</sub> are the parameters to be estimated. Here, E<sub>t</sub> and R<sub>t</sub> represent government expenditure and government revenue at time t respectively. Et.i and Rt-i represent government expenditure and government revenue at time t- i, i=1,2,3,..., respectively.  $e_1$  and  $e_2$  are the stochastic error terms, called impulse or innovations or shocks in the VAR model.

These equations do not represent any joint relationship between Et and Rt. These equations, therefore, represent seemingly unrelated regression SUR model. The estimation of the model considers and uses the contemporaneous Var-Covariace matrix( $\Omega$ ) of the error terms involved such that  $\Omega = Var-Cov(u,u)$  where  $\Omega$  is a positive matrix.

Now, we report the Granger causality test results obtained by vector Auto Regression (VAR) for all sample countries. Due to the use of annual data, the lag order of 1, 2 1nd 3 years are estimated. Results are reported in the Tables 7.1, 7.2, 7.3 & 7.4.

# Table 7.1 Granger Causality Test Results via VAR (Indonesia)

\*denotes significance at 5% level. /  $\Delta$  denotes first difference order.

#### 7.2 Findings

It is observed from the Table 7.1 that in both revenue and expenditure equations with lag order 1 all the coefficients of first period lagged independent variables are insignificant at 5% level of significance. For lag order 2, in expenditure equation the first period lagged revenue is not significant at 5% level but second period lagged revenue i.e  $\Delta R_{t-2}$  is significant at 5% level. In revenue equation all the coefficients of first and second period lagged independent variables are insignificant at 5% level of significance. In case of lag order 3 the coefficient of second period lagged revenue *i.*  $e \Delta R_{t-2}$  is significant at 5% level in expenditure equation but all the coefficients of first, second and third period lagged independent variables are not significant at 5% level in revenue equation. Hence the Table 7.1 reports that revenue Granger causes expenditure suggesting tax-and- spend doctrine being followed in the country concerned.

## 7.3 Findings

Table 7.2 reports that with lag order 1, all coefficients of first period lagged independent variables are not significant at 5% level in both revenue and expenditure equations. For lag order 2, first period lagged expenditure is significant at 5% level in expenditure equation. In revenue equation with lag order 2, all coefficients of first and second period lagged explantory variables are insignificant at 5% level. For lag order 3, all the coefficients of lagged independent variables in revenue equation are insignificant at 5% level but the coefficient of first period lagged expenditure in expenditure equation is significant at 5% level. So it is evident from the results that revenue decisions are made from expenditure decisions in Malaysia over the period of study. This outcome suggests that fiscal neutrality principle was followed in Malaysia over the period concerned.

### 7.4 Findings

The results in Table 7.3 indicate that in expenditure equation with lag order 1, the coefficient of first period lagged revenue is significant at 5% level and in revenue equation, the coefficient of first period lagged revenue is significant at 5% level. So the results indicate that revenue causes expenditure in Singapore during the period of study. For lag order 2 all coefficients of lagged independent variables in revenue equation are insignificant at 5% level. In expenditure equation the coefficient of first period lagged revenue is significant at 5% level. In expenditure equation the coefficient of first period lagged revenue is significant at 5% level. The result implies that there is a one way direction of causal link running from revenue to expenditure in Singapore during the study period. In case of lag order 3, in expenditure equation the coefficients of lagged independent variables are insignificant at 5% level. The results indicate that tax-and-spend principle was followed in Singapore during the period of study.

\*denotes significance at 5% level./  $\Delta$  denotes first difference order.

## 7.5 Findings

It is observed from Table 7.4 that in both revenue and expenditure equation with three different lag orders 1, 2 and 3 all coefficients of lagged independent variables are not significant at 5% level. The results imply that there is no causality link between revenue and expenditure in Thailand during the period of study. This outcome suggests that fiscal neutrality principle was followed in Thailand over the period concerned.

## 7.6 Summary of the Findings in section 7.2-7.5

All the empirical findings suggest that unidirectional causality running from revenue to expenditure exists in Indonesia and Singapore over the period of study and there is no evidence in support of the causality link in any direction between government expenditure and government revenue for Malaysia and Thailand over the period of study. This implies that revenue consideration was the main guiding factor behind the formation of expenditure profile in Indonesia and Singapore during the period of study. However, in case of Malaysia and Thailand government takes the decision of revenue and expenditure independently for preparing budget over the period of study.

In order to confirm the Granger causality link between revenue and expenditure on the basis of VECM and VAR model the standard Granger Causality Test have been performed on the basis of F-Statistics. Table 7.5 reports the results of Granger Causality Test.

Lag Length	1		2		3		
	F-		F-		F-		
Null Hypothesis	Statistics	Probability	Statistics	Probability	Statistics	Probability	Decision
Indonesia							
$\Delta E$ does not Granger cause $\Delta R$	0.13	0.72	1.07	0.35	0.67	.57	Accepted
$\Delta R$ does not Granger cause $\Delta E$	0.06	0.80	2.43	0.10*	1.51	.23	Rejected
Malaysia							
$\Delta E$ does not Granger cause $\Delta R$	0.78	0.38	0.74	0.48	0.78	0.51	Accepted
$\Delta R$ does not Granger cause $\Delta E$	0.22	0.63	0.14	0.86	0.15	0.92	Accepted
Singapore							
$\Delta E$ does not Granger cause $\Delta R$	0.67	0.57	0.87	0.42	0.67	0.57	Accepted
$\Delta R$ does not Granger cause $\Delta E$	2.89	0.05*	3.95	0.02*	2.89	0.05*	Rejected
Thailand							
$\Delta E$ does not Granger cause $\Delta R$	0.01	0.95	0.10	0.90	1.70	0.18	Accepted
$\Delta R$ does not Granger cause $\Delta E$	0.44	0.50	1.54	0.24	0.13	0.94	Accepted

**Table-7.5: Results of Standard Granger Causality Test** 

\* denotes rejection of null hypothesis.

#### 7.7 Findings

It is evident from the Table 7.5 that there is no causal relationship between government revenue and government expenditure in Malaysia and Thailand over the period of study which confirms our findings as reported from VAR and also VECM. However it is clear from the table 7.5 that principle of tax- and- spend was persistent for Indonesia and Singapore over the chosen period and the finding reinforces our results obtained from VAR and also VECM. Therefore, it may be held that fiscal neutrality principle did exist in Malaysia and Thailand and Tax- and- Spend Principle held good in Indonesia and Singapore over the respective periods of study.
