## CHAPTER-IV

## Section A

## Green Synthesis of 3,4-dihydropyrimidine-2-(1H)-ones (DHPMs) using Iron Borate as an Efficient Catalyst

## 4.A. 1 Background of the present investigation

In synthetic organic chemistry, it is becoming increasingly important to develop clean and environmentally sound chemical processes that use less hazardous reaction conditions and covers the essential prospects of green chemistry principle. Solvent free reaction on one hand provides avenues for the requirement of green chemical condition as this reaction condition are highly significant from both the economic and environmental point of view ${ }^{1}$. Now a days, one-pot Multicomponent Reactions are gaining lot of interest for the synthesis of wide range of biologically active heterocyclic compounds ${ }^{2}$. Thus, the combination of solvent free reaction condition and one-pot Multicomponent reaction could serve as an optimal and efficient method for the synthesis of diverse class of heterocyclic compounds under green chemical conditions. Since this type of combination has many added advantages such as short reaction time, economical, environmentally benign, elimination of hazardous solvents and easy work up procedure over the classical synthetic methods ${ }^{3}$. Among the numerous Multicomponent reactions, Bigenelli reaction is used for the direct synthesis of 3,4-dihydropyrimidine-2-(1H)-one derivatives. The Bigenelli Reaction coined by Italian Chemist Pietro Bigenelli in 1893 is one of the most important and useful multicomponent condensation reaction involving an aldehyde, urea and $\beta$ dicarbonyl compounds to yield 3,4-dihydropyrimidine-2-(1H)-ones (Fig. 4.A.1a). These compounds are somewhat similar to dihydropyridines also known as Hantzsch pyridines as the preparation of these compounds also requires the same reactants as required for preparation of Bigenelli compounds ${ }^{4}$. The reaction can also be carried out by using thiourea in place of urea to yield 3,4-dihydropyrimidine-2-(1H)-thione (Fig. 4. A.1b) ${ }^{5}$. In recent times, DHPMs have gained a lot of attention of chemists because of their biological and therapeutic uses ${ }^{6}$. These compounds are one among the five classes of Calcium Channel blocking drugs ${ }^{7-8}$. They also have anti-viral ${ }^{9}$, anti-inflammatory, anti-bacterial ${ }^{10}$, $\alpha$-1a-adrenergic antagonist ${ }^{11}$, antitumor ${ }^{12}$, anti-cancer ${ }^{13}$, anti-HIV ${ }^{14}$, anti-inflammatory ${ }^{15}$ properties. Apart from these properties, DHPMs also have shown other significant properties like anti-oxidant ${ }^{16}$, antimuscarinic ${ }^{17}$, antithyroid ${ }^{18}$, antiparasitic ${ }^{19}$, antidiabetic ${ }^{20}$, Urease Inhibition ${ }^{21}$, Carbonic anhydrase inhibition ${ }^{22}$, cardiac effects ${ }^{23}$. DHPMs are also present in some polyguanidine alkaloids like batzelladine that have found been found to be HIV gp-120-CD-4 inhibitors ${ }^{24}$. Few important drugs that contain the DHPM moiety are monastrol (99), riboflavin (100), 5-Fluoro uracil (101), aminophylline (102), idoxuridine (103) Fig.4. A.2.

Fig. 4.A.1a-1b. 1a) Structure of yield 3,4-dihydropyrimidine-2-(1H)-one and 1b) 3,4-dihydropyrimidine-2-(1H)-thione

Fig. 4.A.2. Structures of few drugs that contain the DHPM moiety

In view of the diverse pharmacological, medicinal, biological and industrial properties associated with 3, 4-dihydropyrimidine derivatives, numerous synthetic methodologies have been developed during the past few decades under both classical and green chemical conditions ${ }^{25-26}$. However, these reported synthetic procedures found to contain one or more serious drawbacks such as use of expensive catalyst, non-recyclable catalyst, moisture sensitive metal salts, long reaction time, low yield, large amount of catalyst loading, use of hazardous solvent, tedious work-up procedure and environmental pollution ${ }^{27}$. Thus, the development of a clean, environmentally benign and economically cost-effective
protocol for the synthesis of 3, 4-dihydropyrimidine-2-( 1 H )-one derivatives is highly demanding and, in this context, synthetic chemists are devoting time to develop a protocol for solvent free synthesis, solid phase synthesis and even reaction in water medium. The prominent advantages of solvent free, solid phase or reaction in water medium is that it omits the use of the environmentally hazardous solvents which definitely reduce chemical pollution and at the same time reduce the cost of the work ${ }^{28}$. Therefore, in order to overcome these shortcomings and fulfilling the criteria of green chemistry principle and sustainable chemistry, in this chapter, we are reporting the synthesis of 3, 4-dihydropyrimidine-2- $(1 \mathrm{H})$-one derivatives using inexpensive iron borate as a catalyst under solvent free condition.

## 4.A.2. Results and Discussions

The classical method for the synthesis of 3,4-dihydropyrimidine-2-ones (4) involves a one pot condensation of $\beta$-keto ester (1), aldehyde (2) and urea (3) under harsh acidic conditions with low yield of the products ${ }^{29}$. Thus, it has become inevitable that the synthesis of 3, 4-dihydropyrimidine-2-ones to be pursued in an environmentally friendly manner for its use in different fields ${ }^{30}$. Although a large variety of new catalytic / modified synthetic protocols such as microwave assisted, Ultrasound irradiation, use of ionic liquid, solvent free synthesis has been developed for the synthesis of 3, 4-dihydropyrimidine-2-one derivatives in an elegant manner during the past few decades yet these reported protocols encounter some serious limitations as discussed above ${ }^{31-40}$. These factors prompted us to find a new catalyst for the synthesis of Bigenelli derivatives under solvent free condition. A number of reports are available for the synthesis of 3, 4-dihydropyrimidine-2-one derivatives using different iron salts as a catalyst under different reaction condition but there is not a single report for the synthesis of the above mention derivatives using iron borate as a catalyst. Therefore, it was thought worthwhile to explore the catalytic efficacy of iron borate for the synthesis of 3, 4-dihydropyrimidine-2-one derivatives (4) by one-pot cyclo-condensation of $\beta$ dicarbonyl compound (1), Aldehyde (2) and Urea (3) under solvent free reaction condition following the green chemistry protocol (Scheme 4.A.1).

Scheme. 4.A.1. Schematic representation of Bigenelli reaction catalyzed by Fe borate catalyst

Initially, for the synthesis 3, 4-dihydropyrimidine-2-ones (4), we choose ethylacetoacetate (1), 2-nitrobenzaldehyde (2) and urea (3) as model compounds under different environmentally friendly reaction conditions at $80^{\circ} \mathrm{C}$ for 3 hours using different mol\% ( 0.5 to 4 ) of the catalyst iron borate. We choose the different solvent systems as well for screening the catalytic efficiency of the catalyst with model reactants under different conditions and the results are summarized in Table 4.A. 1

Table. 4.A.1. Screening of the solvent for control reaction

| Entry | Solvent $^{\mathrm{a}}$ | Time (hours) | Yield $^{\mathrm{b}}$ |
| :---: | :---: | :---: | :---: |
| 1 | Ethanol | 3 | 86 |
| 2 | Methanol | 3 | 82 |
| 3 | DMF | 3 | 90 |
| 4 | DMSO | 3 | 80 |
| 5 | Water | 3 | 40 |
| 6 | Silica Gel | 1 | 86 |
| $\mathbf{7}$ | Neat | $\mathbf{8 ( m i n s )}$ | $\mathbf{9 7}$ |

${ }^{\text {a }}$ The reaction was performed with Ethylacetoacetate $1(1 \mathrm{mmol})$, 2-nitroBenzaldehyde 2 ( 1 mmol ), and Urea $3(1 \mathrm{mmol})$ with the catalyst using different solvents. ${ }^{\text {b }}$ Isolated Yields.

We observed that the Biginelli reaction proceed well in more polar solvent like alcohol, DMF and DMSO (Table 4.A.1, entry 1, 2, 3, 4) but we observed that under this condition, the reaction needed more time to go for completion. Therefore, we focused our study towards the green protocol employing solid phase
synthesis using silica gel as a reaction medium but in this case also we found that under this condition, the work-up of the desired product needs more attention and rigorous techniques such as column chromatography to recover the final product (Table 4.A.1, entry 6).

Therefore, these limitations prompted us to investigate more suitable and environmentally friendly reaction condition for the synthesis of 3, 4-dihydropyrimidine-2-ones (4). As a part of the green chemical methodology, we were interested to carry out the above reaction under solvent free condition and encouragingly we encountered that the desired product formed with good yield and less reaction time (6-8 minutes) (Table 4.A.1, entry 7). The results of the model reaction for different $\mathrm{mol} \%$ of the catalyst loading under optimized condition are listed in Table 4.A.2.

Table. 4.A.2. Screening of the amount of the catalyst for the model reaction

| Entry | Catalyst mol <br> $\%^{\mathrm{a}}$ | Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Time <br> (Minutes) | Yield $^{\mathrm{b}}$ <br> $(\%)$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 80 | 8 | 15 |
| 2 | 0.5 | 80 | 8 | 65 |
| 3 | 1.0 | 80 | 8 | 70 |
| 4 | 1.5 | 80 | 8 | 73 |
| 5 | 2.0 | 80 | 8 | 80 |
| 6 | 2.5 | 80 | 8 | 91 |
| 7 | $\mathbf{3 . 0}$ | $\mathbf{8 0}$ | $\mathbf{8}$ | $\mathbf{9 7}$ |
| 8 | 3.5 | 80 | 8 | 94 |
| 9 | 4.0 | 80 | 8 | 94 |
| ${ }^{\text {a }}$ |  |  |  | 8 |

${ }^{\text {a }}$ The reaction was performed withEthyl acetoacetate $1(1 \mathrm{mmol})$ 2-nitrobenzaldehyde $2(1 \mathrm{mmol})$, and Urea $3(1 \mathrm{mmol})$ with the catalyst under solvent free condition. ${ }^{\mathrm{b}}$ Isolated Yields.

Interestingly, we observed that the reaction proceeds in much faster rate under solvent free condition in short reaction time ( 8 minutes) when the amount of catalyst loading is $3 \mathrm{~mol} \%$ (Table 4.A.2, entry 7). A controlled reaction without catalyst leads to the formation of the product in negligible amount (Table 4.A.2, entry 1). Having recognized the optimal reaction condition, we subsequently examined the catalytic efficiency and applicability of this protocol by extending this protocol with differently substituted aldehydes (2) and keeping the component (1) and (3) fixed (Fig. tt). We examined that all the reactions proceeded well and smoothly in very short reaction time to afford the desired products, 3,4-
dihydropyrimidine-2-ones (4a-r) in good to excellent yields (90-98\%) (Fig 4.A. 3 and Table 4.A.3).

Fig. 4.A.3. Pictorial representation of the Biginelli products (4a-4q).

Table. 4.A.3. Iron Borate catalyzed solvent free neat synthesis of $3,4-$ dihydropyrimidine-2-one derivatives ( $4 \mathrm{a}-4 \mathrm{q}$ )

| Entry | B-keto ester | Aldehyde substrate | Product | Yield $^{\mathrm{b}}$ <br> $(\%)$ |
| :--- | :--- | :---: | :---: | :---: |
| 1 | Ethylacetoacetate | Benzaldehyde | 4 a | 97 |
| 2 | Ethylacetoacetate | 2-nitrobenzaldehyde | 4 b | 98 |
| 3 | Ethylacetoacetate | 3-nitrobenzaldehyde | 4 c | 97 |

| 7 | Ethylacetoacetate | 4-fluorobenzaldehyde | 4 g | 97 |
| 8 | Ethylacetoacetate | 2,4-dimethylbenzaldehyde | 4 h | 93 |
| 9 | Ethylacetoacetate | 2,4-dihydroxybenzaldehyde | 4 i | 92 |
| 10 | Ethylacetoacetate | 2-hydroxybenzaldehyde | 4 j | 95 |
| 11 | Ethylacetoacetate | 5-chloro-2-hydroxybenzaldehyde | 4 k | 96 |
| 12 | Ethylacetoacetate | 5-nitro-2-hydroxybenzaldehyde | 41 | 95 |
| 13 | Ethylacetoacetate | 4-hydroxy-3-methoxybenzaldehyde | 4 m | 88 |
| 14 | Ethylacetoacetate | 3-hydroxybenzaldedhyde | 4 n | 90 |
| 15 | Ethylacetoacetate | 3,4,5-trimethoxybenzaldehyde | 4 o | 88 |
| 16 | Ethylacetoacetate | 4-hydroxy-3, 5-dimethoxybenzaldehyde | 4 p | 88 |
| 16 | Ethylacetoacetate | Indole-3-carboxaldehyde | 4 q | 90 |

Moreover, it is interesting to note that para-substituted benzaldehyde with electron withdrawing group successfully afforded the corresponding product in excellent yield under optimized condition as compared to the electron releasing group present at the same position. Ortho and meta-substituted aldehydes also afforded the desired products in good yields but they required more time for reaction to complete.

We then compared the catalytic efficacy of the iron borate with different catalyst reported in the literature documented elsewhere and we found that iron borate has high catalytic efficiency and recyclability as compared to other catalyst and needs only few minutes for the completion of the reaction. Surprisingly, we could recover the catalyst after $4^{\text {th }}$ run also and we observed that the catalyst lost its efficiency partially after $5^{\text {th }}$ run of the reaction (Table 4.A.4).

Table. 4.A.4. Study on the recyclability of the catalyst

| Entry | No. of runs | Isolated yields (\%) |
| :---: | :---: | :---: |
| 1 | 1 | 97 |
| 2 | 2 | 95 |
| 3 | 3 | 92 |
| 4 | 4 | 88 |
| 5 | 5 | 75 |
| 6 | 6 | 71 |

Fig. 4.A.4. Recyclability of the catalyst

It was observed during the reaction that a variety of functional groups like acidic, nitro, methoxy, etc. remains un-affected during the reaction. Substituted benzaldehydes with either electron donating or electron withdrawing groups afforded good yield of the products, however it was also found that benzaldehyde with electron releasing groups gave a slight less yield of the products. We also compared the catalytic efficiency of Iron borate with other previously reported catalysts and found that Iron Borate has high catalytic efficiency and required less reaction time to go for completion Table 4.A.5.

Table. 4.A.5. Comparison of Catalytic efficiency of Iron Borate with other reported catalysts for the synthesis of 3,4-dihydropyrimidine-2-one derivatives (4a$4 q)$.

## 4.A. 3 Plausible Mechanism

The Biginelli reaction may proceed through acylimine intermediate (5) which is formed by the imine reaction between an aldehyde (2) and urea (3) catalyzed by iron borate. Further, addition of enolate of $\beta$ keto-ester (1) to acylimine intermediate followed by dehydration and cyclization leads to the formation of corresponding dihydropyrimidinone derivative (4). A proposed mechanism for the synthesis of 3, 4-dihydropyrimidine-2-one catalyzed by Fe-borate is depicted below in Scheme 4.A.2.

Scheme. 4.A.2. Proposed mechanism for the synthesis of 3, 4-dihydropyrimidine-
2-one catalyzed by Fe-borate

## 4.A. 4 Experimental Section

## 4.A.4.1 Materials

All starting materials of high purity for the described synthesis were purchased commercially as received. The FT-IR spectra of the prepared compounds were recorded in Bruker Alpha III spectrophotometer operating in the wave number region 4000 to $400 \mathrm{~cm}^{-1}$ in dry KBr . The melting points of the synthesized compounds were determined by open capillary method. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of the synthesized 3,4-dihydropyrimidine-2-one derivatives ( $4 \mathrm{a}-4 \mathrm{u}$ ) were recorded at room temperature on a FT-NMR (Bruker Advance-II 400 MHz ) spectrometer by using DMSO-d ${ }_{6}$ as solvents and chemical shifts are quoted in ppm downfield of internal standard tetramethylsilane(TMS).

## 4.A.4.2 General procedure for the synthesis of 3,4-dihydropyrimidine-2-ones:

In a typical procedure, a mixture of substituted benzaldehyde ( 1.0 mmol ), ethylacetoacetate ( 1.0 mmol ), urea ( 1.0 mmol ) and Iron borate ( $3 \mathrm{~mol} \%$ ) thoroughly ground and mixed in a mortar and pestle to make a homogenous mixture. The mixture was then transferred to a test tube. The reaction was heated at $80^{\circ} \mathrm{C}$ for 8 minutes. The progress of the reaction was monitored by TLC using hexane/ethyl acetate $(80: 20)$ solvent. After completion of the reaction, the reaction mixture was dissolved in methanol and filtered. The filtrate was evaporated under vacuum and subsequently dried to afford desired product. All the synthesized compounds $(4 a-4 q)$ were recrystallized from ethanol and have been characterized by their analytical (yield and melting point value) and spectroscopic data (FT-IR and ${ }^{1} \mathrm{HNMR}$ ) and compared with the literature value.

## 4.A.5. Conclusion

In this chapter, we described a simple, green and efficient procedure for the synthesis of 3.4- dihydropyrimidine-2-one derivatives using an unconventional Iron borate catalyst under solvent free condition. The reaction provides a method for the synthesis of a variety of 3, 4-dihydropyrimidine-2-ones with good to excellent yields and the catalyst has been versatile for a wide range of aromatic aldehydes.

## 4.A.6. Analytical and Spectroscopic data

4.A.6.1 Ethyl 1,2,3,4-tetrahydro-6-methyl-2-oxo-4-phenylpyrimidine-5carboxylate (4a): white solid, yield $=97 \%$, melting point found $\left({ }^{\circ} \mathrm{C}\right)=202-205$, IR ( $\mathrm{cm}^{-1}$ ) $v_{\text {max }}$ : IR ( $\mathrm{cm}^{-1}$ ) $v_{\max }: 3442,3298,3190,2981,(\mathrm{~N}-\mathrm{H}), 1685,1651(\mathrm{C}=\mathrm{O})$, ${ }^{1}$ HNMR ( 400 MHz , DMSO d ${ }_{6}$ ): $\delta \mathrm{ppm}=9.36(\mathrm{~S}, 1 \mathrm{H}, \mathrm{NH}), 7.54(\mathrm{~S}, 1 \mathrm{H}, \mathrm{NH})$, 7.31$7.43(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 5.66(\mathrm{~d}, 1 \mathrm{H}), 3.46\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.50(\mathrm{~S}, 3 \mathrm{H}, \mathrm{CH} 3), 1.07(\mathrm{t}$, $3 \mathrm{H}, \mathrm{CH}_{3}$ ).
4.A.6.2 Ethyl 1,2,3,4-tetrahydro-6-methyl-4-(2-nitrophenyl)-2-oxopyrimidine-5-carboxylate (4b): yellow powder, yield $=98 \%$, melting point found $\left({ }^{\circ} \mathrm{C}\right)=219$ 221, IR (KBr, $\mathrm{cm}^{-1}$ ) $v_{\text {max }}$ : 3443, 3369, $3235(\mathrm{NH}), 1685,1636 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{O}),{ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO-d6): $\delta \mathrm{ppm}=9.92(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 8.32(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.51(\mathrm{~d}$, $1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.23-7.27(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 5.41(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 4.51\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right.$ of ethyl), $2.49\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.31\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.3 Ethyl 1,2,3,4-tetrahydro-6-methyl-4-(3-nitrophenyl)-2-oxopyrimidine-5-carboxylate (4c): yellow solid, yield $=97 \%$, melting point found $\left({ }^{\circ} \mathrm{C}\right)=226$ 229 , IR ( $\mathrm{cm}^{-1}$ ) $v_{\text {max }}: 3444,3100,2985(\mathrm{NH}), 1655,1532$ ( C=O), ${ }^{1} \mathrm{HNMR}$ (400 $\left.\mathrm{MHz}, \mathrm{DMSO} \mathrm{d}_{6}\right): \delta \mathrm{ppm}=9.39(\mathrm{~S}, 1 \mathrm{H}, \mathrm{NH}), 8.38(\mathrm{~S}, 1 \mathrm{H}, \mathrm{NH}), 7.17-7.19(\mathrm{~m}, 2 \mathrm{H}$, Ar-H), 7.75-7.82 (m, 2H, Ar-H), 5.78 (S, 1H, CH), 4.25 (q, 2H, CH2), $2.84(\mathrm{~S}, 3 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right), 1.18\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.4 Ethyl 1,2,3,4-tetrahydro-6-methyl-4-(4-nitrophenyl)-2-oxopyrimidine-5-carboxylate (4d): pale yellow solid, yield $=97 \%$, melting point found $\left({ }^{\circ} \mathrm{C}\right)=$ 208-210, IR ( $\mathrm{cm}^{-1}$ ) $v_{\text {max }}: 3455 \mathrm{~cm}^{-1}, 2966 \mathrm{~cm}^{-1}(\mathrm{~N}-\mathrm{H}), 1659 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{O}),{ }^{1} \mathrm{HNMR}$ $\left(400 \mathrm{MHz}\right.$, DMSO d $\left._{6}\right): \delta \mathrm{ppm}=9.29(\mathrm{~S}, 1 \mathrm{H}, \mathrm{NH}), 8.23(\mathrm{~d}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.58(\mathrm{~d}, 2 \mathrm{H}$, Ar-H), $6.96(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 6.17(\mathrm{~S}, 1 \mathrm{H}, \mathrm{NH}), 5.78(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 3.38\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $2.50\left(\mathrm{~S}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.08\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.5 Ethyl 4-(3-bromophenyl)-1,2,3,4-tetrahydro-6-methyl-2-oxopyrimidine-5-carboxylate (4e): White Crystals, yield $=96 \%$, melting point found $\left({ }^{0} \mathrm{C}\right)=189-191$, , IR $\left(\mathrm{cm}^{-1}\right) v_{\text {max }}$ : $3448,3240,3112(\mathrm{NH}), 1672,1621(\mathrm{C}=\mathrm{O})$, ${ }^{1} \mathrm{HNMR}(400 \mathrm{MHz}$, DMSO d ): $\delta \mathrm{ppm}=9.98(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.95(\mathrm{~S}, 1 \mathrm{H}, \mathrm{NH}), 7.30-$ $7.73(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 5.43(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 4.24\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.27\left(\mathrm{~S}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.23$ ( $\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ).
4.A.6.6 Ethyl 4-(2-chlorophenyl)-1,2,3,4-tetrahydro-6-methyl-2-oxopyrimidine-5-carboxylate (4f): White solid, yield $=97 \%$, melting point found $\left({ }^{0} \mathrm{C}\right)=221-225$, IR $\left(\mathrm{cm}^{-1}\right) v_{\max }: 3354 \mathrm{~cm}^{-1}, 3235,3111(\mathrm{~N}-\mathrm{H}), 1662,1640 \mathrm{~cm}^{-1}($ $\mathrm{C}=\mathrm{O}$ ), ${ }^{1} \mathrm{HNMR}\left(400 \mathrm{MHz}, \mathrm{DMSO}_{6}\right): \delta \mathrm{ppm}=9.32(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.70(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH})$, $7.21-7.40(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 5.59(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 4.11\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.28\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, $1.08\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.7 Ethyl 4-(4-fluorophenyl)-1,2,3,4-tetrahydro-6-methyl-2-oxopyrimidine-5-carboxylate (4g): White Crystals, yield $=97 \%$, melting point found $\left({ }^{0} \mathrm{C}\right)=208-212$, IR $\left(\mathrm{cm}^{-1}\right) v_{\text {max }}: 3326,3200 \mathrm{~cm}^{-1}(\mathrm{~N}-\mathrm{H}), 1695,1625 \mathrm{~cm}^{-1}($ $\mathrm{C}=\mathrm{O}$ ), ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , DMSO-d6): $\delta \mathrm{ppm}=9.32(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.62(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH})$, 7.21-7.42(m, 4H, Ar-H), $5.22(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 3.85\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right.$ of ethyl), $2.24(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{CH}_{3}$ ), $1.12\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.8. Ethyl 1,2,3,4-tetrahydro-6-methyl-4-(2,4-dimethylphenyl)-2-oxopyrimidine-5-carboxylate (4h): White Crystals, yield= $93 \%$, melting point found $\left({ }^{\circ} \mathrm{C}\right)=199-202$, IR $\left(\mathrm{cm}^{-1}\right) v_{\text {max }}: 3234,3313,3171,2933(\mathrm{~N}-\mathrm{H}), 1700,1648($ $\mathrm{C}=\mathrm{O}$ ), ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , DMSO-d6): $\delta \mathrm{ppm}=9.24(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.58(\mathrm{~s}, 1 \mathrm{H}$, NH), $6.68-6.78(\mathrm{~m}, 3 \mathrm{H}, \operatorname{Ar}-\mathrm{H}), 5.18(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 4.08\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.38(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right), 1.05\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.9 Ethyl 1,2,3,4-tetrahydro-4-(2,4-dihydroxyphenyl)-6-methyl-2-oxopyrimidine-5-carboxylate (4i): Pale brown Crystals, yield= $92 \%$, IR ( $\mathrm{cm}^{-1}$ ) $v_{\text {max }}: 3449,3234(\mathrm{~N}-\mathrm{H}), 1664,1626(\mathrm{C}=\mathrm{O}), 1 \mathrm{HNMR}(400 \mathrm{MHz}$, DMSO-d6): $\delta \mathrm{ppm}$ $=12.97(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 11.79(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 10.18(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 8.51(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 6.79-$ $7.18(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 5.42(\mathrm{~d}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 4.02\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.49\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.25(\mathrm{t}$, $3 \mathrm{H}, \mathrm{CH}_{3}$ ).
4. A.6.10 Ethyl 1,2,3,4-tetrahydro-4-(2-hydroxyphenyl)-6-methyl-2-oxopyrimidine-5-carboxylate (4j): White solid, yield= $93 \%$, melting point found $\left({ }^{\circ} \mathrm{C}\right)=203-206$, IR $\left(\mathrm{KBr}, \mathrm{cm}^{-1}\right) v_{\text {max }}: 3348(\mathrm{O}-\mathrm{H}), 3244,3082(\mathrm{~N}-\mathrm{H}), 1686,1638$ $(\mathrm{C}=\mathrm{O}),{ }^{1} \mathrm{HNMR}(400 \mathrm{MHz}$, DMSO-d6): $\delta \mathrm{ppm}=13.34(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 8.94(\mathrm{~s}, 1 \mathrm{H}$, NH ), $8.93(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 6.84-7.38(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 6.82(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 3.38$ (q, 2H, $\mathrm{CH}_{2}$ ), 2.55( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ), $1.913\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.11 Ethyl 4-(5-chloro-2-hydroxyphenyl)-1,2,3,4-tetrahydro-6-methyl-2-oxopyrimidine-5-carboxylate (4k): Dirty white sloid, melting point found $\left({ }^{0} \mathrm{C}\right)=$ 208-211, IR (KBr, $\left.\mathrm{cm}^{-1}\right) v_{\text {max }}: 3443(\mathrm{OH}), 3298,2955(\mathrm{NH}), 1666,1625(\mathrm{C}=\mathrm{O})$, ${ }^{1} \mathrm{HNMR}$ ( 400 MHz , DMSO-d6): $\delta \mathrm{ppm}=9.36(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 7.54(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH})$, $7.52(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.30-7.43(\mathrm{~m}, 3 \mathrm{H}, \operatorname{Ar-H}), 5.48(\mathrm{~d}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 3.45\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $2.45\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.29\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4. A.6.12 Ethyl 1,2,3,4-tetrahydro-4-(2-hydroxy-5-nitrophenyl)-6-methyl-2-oxopyrimidine-5-carboxylate (5I): yellow solid, IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ) $v_{\text {max }}: 3442$ (OH), 3125, 2954, $2924(\mathrm{NH}), 1731,1681$ (C=O), ${ }^{1}$ HNMR ( 400 MHz , DMSO-d6): $\delta \mathrm{ppm}=9.91(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 8.53(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 8.40(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.48-7.82(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}-$ H), 6.91-6.89 (d, 1H, Ar-H), $5.43(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 3.40\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.25\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, 2.51(t, $\left.3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4. A.6.13 Ethyl 1,2,3,4-tetrahydro-4-(4-hydroxy-3-methoxyphenyl)-6-methyl-2-oxopyrimidine-5-carboxylate ( 4 m ): yellow solid, IR $\left(\mathrm{KBr}, \mathrm{cm}^{-1}\right) v_{\text {max }}$ : $3425(\mathrm{OH}), 3348$ 3125, 2974, $2924(\mathrm{NH}), 1731,1681(\mathrm{C}=\mathrm{O}),{ }^{1} \mathrm{HNMR}(400 \mathrm{MHz}$, DMSO-d6): $\delta=9.12(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 8.51(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.63(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 6.51-6.79(\mathrm{~m}$,
$3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 5.42(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 4.00\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.72\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.47(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right), 1.16\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.14 Ethyl 1,2,3,4-tetrahydro-4-(3-hydroxyphenyl)-6-methyl-2-oxopyrimidine-5-carboxylate (4n): Dirty white powder, yield $=88 \%$, melting point found $\left({ }^{0} \mathrm{C}\right)=258-261$. IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ) vmax:3443 (O-H), 3244, 3110, 2950(N-H), 1647, 1578(C=O), ${ }^{1}$ HNMR ( 400 MHz , DMSO-d6): $\delta \mathrm{ppm}=9.97(\mathrm{~s}$, $1 \mathrm{H}, \mathrm{OH}), 9.35(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.66(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 6.50-6.74(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 5.62(\mathrm{~s}, 1 \mathrm{H},-$ $\mathrm{C}-\mathrm{H}), 3.37\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.22\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.10\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.15 Ethyl 1,2,3,4-tetrahydro-4-(3,4,5-trimethoxyphenyl)-6-methyl-2-oxopyrimidine-5-carboxylate (40): White solid, yield $=88 \%$, melting point found $\left({ }^{0} \mathrm{C}\right)=202-206$, IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ) $v_{\text {max }} 3443(\mathrm{O}-\mathrm{H}), 3364,3302,2971(\mathrm{~N}-\mathrm{H})$, 1660, 1595(C=O), ${ }^{1}$ HNMR ( 400 MHz , DMSO-d6): $\delta \mathrm{ppm}=9.80(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH})$, 9.20(s, 1H, NH), $7.25(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 6.87(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 6.64$ (s, 1H, Ar-H), $5.40(\mathrm{~s}$, $1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 3.85\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 3.71\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{3}\right), 3.67\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{3}\right), 3.62(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{O}-\mathrm{CH}_{3}\right), 3.37\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.27\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.16 Ethyl 1,2,3,4-tetrahydro-4-(4-hydroxy-3,5-dimethoxyphenyl)-6-methyl-2-oxopyrimidine-5-carboxylate (4p): Dirty white solid, yield=88 \%, IR $\left(\mathrm{KBr}, \mathrm{cm}^{-1}\right) v_{\max }: 3433(\mathrm{O}-\mathrm{H}), 3302,2970,2926(\mathrm{~N}-\mathrm{H}), 1665,1627(\mathrm{C}=\mathrm{O}),{ }^{1} \mathrm{HNMR}$ ( 400 MHz, DMSO-d6): $\delta \mathrm{ppm}=11.40(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 9.77(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 8.31(\mathrm{~s}, 1 \mathrm{H}$, $\mathrm{NH}), 7.20(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 6.92$ (s, 1H, Ar-H), $5.39(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 3.88\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{OCH}_{3}\right)$, $3.31\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.49\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.21\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
4.A.6.17 Ethyl 1,2,3,4-tetrahydro-4-(1H-indol-3-yl)-6-methyl-2-oxopyrimidine-5-carboxylate (4q): brown solid, IR (KBr, $\mathrm{cm}^{-1}$ ) $v_{\text {max }}$ : 3445, $2932(\mathrm{~N}-\mathrm{H}), 1662$, 1632 (C=O), ${ }^{1} \mathrm{HNMR}$ ( $400 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d} 6$ ): $\delta \mathrm{ppm}=12.14$ (s, 1H, NH indole), 9.92(s, 1H, NH), 8.32(s, 1H, NH), 8.27 (m, 1H Ar-H indole), 7.18-7.51(m, 4H, ArH), $5.41(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-\mathrm{H}), 3.33\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.49\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.81\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$.

# CHAPTER-IV 

## Section-B

## DFT, Molecular Docking and Pharmacokinetic study of some selected 3, 4-dihydropyrimidin-2(1H)-one (DHPM) derivatives

## 4.B. 1 Background of the present investigation

Dihydropyrimidin- $2(1 \mathrm{H})$-ones are a class of organic compounds which are synthesized using Bigenelli reaction and have significant biological activity ${ }^{1}$. Dihydropyrimidinones also called as Bigenelli compounds were first prepared by Pietro Bigenelli in the year $1893^{1}$. These classes of compounds have shown promising biological activities like calcium channel anragonists ${ }^{2-3}$, anti-cancer ${ }^{4-5}$, anti-hypertensive ${ }^{6}$, anti-bacterial ${ }^{7}$, anti-inflammatory ${ }^{8}$, $\alpha_{1 \alpha}$ adrenergic antagonists ${ }^{9}$ and HIV-gp-120-CD4 inhibitors ${ }^{10}$. Apart from biological activities, DHPMs are also used as essential building blocks for a variety of other heterocyclic compounds ${ }^{11-17}$ (Fig.4.B.1). Computational chemistry and theoretical calculations based on physicochemical and quantum mechanics involving organic molecules are gaining a lot interest these days as it helps in understanding the geometrical properties, reaction pathways and chemical mechanisms ${ }^{18-19}$. Also, these theoretical techniques provide information about the electronic properties of the reactants, intermediates and products which helps in inculcating new ideas for planning an organic synthesis ${ }^{20-21}$. Recently, Density Functional Theory (DFT) is mostly used for exploring the geometry and electronic properties of organic molecules along with some important properties like dipole moments, optical properties, vibration frequencies and thermodynamic properties ${ }^{22-24}$. The information obtained from theoretical calculations can be compared with the experimental finding which helps to gain a deep insight into the various properties of the compounds under study. With the advancement in computational chemistry, Computer Aided Drug Design (CADD) is an emerging field of research ${ }^{25}$ and it helps to predict the different types of interaction prevailing between the ligand and active site of the protein ${ }^{26}$. Usually, the development of a new drug for a particular disease is a very long tedious and also a costly process ${ }^{27}$ and therefore, CADD method is widely used for drug designing as it efficiently reduces the time and cost for drug discovery ${ }^{28}$.

Fig. 4.B.1. DHPMs as essential building blocks.
Type 2 diabetes mellitus is a condition where regulation and use of glucose by the body is impaired leading to the increase of circulating blood sugar (when in the chronic stages). Eventually, disorders of the circulatory, immune and nervous systems. Type 2 diabetes is primarily the result of two correlated problems namely insulin resistance in cells in muscles, fat and liver causing reduced storage of glucose as glycogen, and the pancreas beta cells are unable to produce enough insulin to keep blood sugar levels in check ${ }^{29}$.It is mostly characterized by hyperglycemia, insulin resistance and relative insulin deficiency ${ }^{30}$. In the 2010s, inhibition of sodium-dependent glucose transporters (SGLTs) have been proposed as a new therapy for the treatment of type 2 diabetes mellitus ${ }^{31}$. SGLT2, the most prominent among all of the SGLTs, is expressed mainly in the kidney and is responsible for the reabsorption of a vast amount of the filtered glucose. Thus, SGLT2 plays a key role in the blood-glucose homeostasis and as such is a prominent target which has been clear from the results of pre-clinical and clinical studies. Any drug discovery project that focuses on promising SGLT2 inhibitors also has to factor in any significant selectivity towards SGLT1 ${ }^{32}$. This is because though there are many therapeutic goals of SGLT2 inhibition like weight loss and
reduced plasma glucose levels, a few side effects may exist due to co-inhibition of SGLT1. SGLT1 being expressed in the intestine is responsible for glucose and galactose absorption from food sources, therefore, leading to galactose- and glucose malabsorption, diarrhoea and dehydration. This can be mediated through lack of selectivity towards SGLT1.

Selectivity of any drug or ligands towards SGLT2 thus needs to be offset by its lack of selectivity towards SGLT1. So, to describe selectivity with respect to structure, extensive use of molecular modelling techniques has been utilized as no x-ray structural data was available for either SGLT1 or SGLT2. Faham S. et al., thus, generated homology models for both transporters using the published x-ray structure from vSGLT (PDB 3DH4) ${ }^{33}$. Although there are numerous drugs available for the treatment of type-2 diabetes mellitus still these drugs have several side effects ${ }^{34}$. So, it is worthwhile to find an efficient drug for this disease with minimum or no side effect.

With the improvements in the field of drug designing, Molecular Docking studies are very popular in studying the different types of interactions between ligand and the receptor ${ }^{35-36}$.

Molecular docking is a virtual procedure which helps to find a ligand that fits exactly and efficiently in the binding site of the protein and is an important tool for accurate drug discovery ${ }^{37-38}$.

Furthermore, a variety of 2,4-dihydropyrimidin-2(1H)-ones using solvent free, green methodology have been prepared in excellent yields and its synthetic procedure, spectroscopic and analytical investigations have been discussed in section-A of chapter 4. In this chapter we are presenting the theoretical aspects of some selected Bigenelli compounds wherein HOMO-LUMO energies, bond lengths, bond angles, dihedral angles, global chemical descriptors and Molecular Electrostatic Potential (MEP) have been studied in detail using DFT. The inhibitory potential of these selected derivatives against the protein 3DH4 which is used in homology studies for the inhibition of Sodium-Dependent Glucose Transporters (SGLTs) have also been reported.

Fig. 4.B.2. Molecular Structures of selected 3, 4-dihydropyrimidin-(2H)-one derivatives (DP-1 to DP-3)

## 4.B.2 Results and Discussions

## 4.B.2.1 Computational Study

The molecular geometry, molecular orbital (HOMO,LUMO), Nonlinear Optical property (NLO), Global chemical descriptors and Molecular Electrostatic Potential (MEP) of the selected 3,4-dihydropyrimidin-(2H)-one derivatives namely, Ethyl 4-(2-hydroxyphenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (DP-1), Ethyl 4-(5-chloro-2-hydroxyphenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (DP-2) and Ethyl 4-(5-bromo-2-hydroxyphenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (DP3) have been optimized by Density Functional Theory (DFT) using Becke's threeparameter hybrid method (B3) with Lee, Yang and Parr correlation functional methods (LYP) with B3LYP/631G+(d,2p) level of basis set ${ }^{39-40}$. All the computational calculations were calculated by Gaussian 16, Revision A.03programme package ${ }^{41}$ and the results were visualized using GAUSSVIEW 6.0 software ${ }^{42}$ on ahp-Z640 desktop P.C. with an Intel Xeon processor (Specifications: E5-2630 V4 @ 220GHz).

## 4.B.2.1.1 Optimization of Molecular Geometry

To the best of our knowledge, the X-Ray single crystal structure of the selected compounds (DP-1 to DP-3) have not been reported till now, therefore, structure optimization using DFT method serves as a good alternative to ascertain the different geometrical parameters. The geometrical parameters of the studied compounds (DP-1 to DP-3) were calculated by DFT assay using B3LYP/631G+(d,2p) level of basis set. The optimized gas phase molecular geometry of the compounds (DP-1 to DP-3) with atom labelling scheme is shown in Fig.4.B. 3 and 4.B. 4 and the structural parameters like bond lengths, bond angles and dihedral angles are listed in Table 4.B.1.

From the analysis of the dihedral angles as given in Table 4.B.1, it can be infered that the phenyl ring is not in plane with the DHPM nucleus as the dihedral angles are nowhere close to $0^{\circ}$ or $180^{\circ}$. The dihedral angle between the phenyl ring (2) and the DHPM nucleus (1) depends on the type of substituent present in the phenyl ring as evident from the fact that in DP-1, the dihedral angle between C17-C12-C6-C5 and between C17-C12-C6-C1 is $34.148^{\circ}$ and $-138.05^{\circ}$ respectively whereas in DP-2 it is $-146.31^{\circ}$ and $26.00^{\circ}$ respectively and in DP-3 it is found to be $147.425^{\circ}$ and $-26.54^{\circ}$ respectively. From Table 4.B.1, it is clearly seen that the C-N bond lengths in the DHPM nucleus (1) of all the studied compounds (DP-1 to DP-3) are in the range C6-N5 $=1.407 \AA-1.413 \AA, \mathrm{C} 4-\mathrm{N} 5=$ $1.370 \AA-1.377 \AA, \mathrm{C} 4-\mathrm{N} 3=1.382 \AA-1.392 \AA, \mathrm{C} 2-\mathrm{N} 3=1.393 \AA-1.401 \AA$ respectively. The $\mathrm{C} 4-\mathrm{N} 5$ and $\mathrm{C} 4-\mathrm{N} 3$ are shorter than $\mathrm{C} 6-\mathrm{N} 5$ and $\mathrm{C} 2-\mathrm{N} 3$ a bond length which suggests that the lone pairs on nitrogen are delocalized on atom C4 which is double bonded with oxygen atom O19. Also, from the optimized geometry, it was found that $\mathrm{C}=\mathrm{O}$ bond length in all the studied compounds (DP-1
to DP-4) fall in the range $\mathrm{C} 7=\mathrm{O} 8=1.210-1.219 \AA, \mathrm{C} 4=\mathrm{O} 19=1.224-1.225 \AA$ respectively. The C-O bond lengths in these compounds (DP-1 to DP-3) are found to be in the range $\mathrm{C} 7-\mathrm{O} 9=1.348-1.358 \AA, \mathrm{C} 10-\mathrm{O} 9=1.450-1.455 \AA$ respectively.

Fig. 4.B.3. Atom labelling of the DHPM nucleus (1) and the phenyl ring (2) in the studied compounds.

The C-C bond lengths of all the aryl groups present in the compounds (DP1 to DP-3) are in the range 1.386 to $1.417 \AA$ which suggests that the carbon atoms are highly conjugated and electrons are involved in resonance ${ }^{43}$.Again, from the table 4.B.1, it is clearly seen that the N-H bond length of the DHPM nucleus (1) in all the studied compounds are almost equal and falls in the range of 1.010-1.012 $\AA$. The aromatic $\mathrm{C}-\mathrm{H}$, aliphatic $\mathrm{C}-\mathrm{H}, \mathrm{O}-\mathrm{H}$, and $\mathrm{C}-$ halogen bond distances of the studied compounds (DP-1 to DP-3) are in the range 1.392-1.417 $\AA, 1.086-1.094 \AA$, 0.963-0.966 $\AA, 1.761-1.909 \AA$ respectively.

## 4.B.2.1.2 Frontier Molecular Orbitals

The Highest occupied molecular orbital (HOMO) and the Lowest Unoccupied Molecular orbital (LUMO) constitutes the frontier molecular orbitals and they are very important in predicting the molecular reactivity. The electron donor ability of a molecule is determined by the energy of HOMO while the electron acceptor ability is determined by the energy of $\mathrm{LUMO}^{44}$. Several important properties like kinetic stability, reactivity and the polarizability of a molecule can be determined by analyzing the energy gap ( $\Delta \mathrm{E}=\mathrm{E}_{\text {Luмо }}-\mathrm{E}_{\text {номо }}$ ) between the HOMO and the $\mathrm{LUMO}^{44}$. Also, a large and positive $\Delta \mathrm{E}$ value indicates that the molecule is less polarizable and is chemically stable ${ }^{45}$. In order to get into a deep insight into the electronic behavior of the studied compounds, the HOMO-LUMO energies have been calculated using B3LYP/631G+(d,2p) basis set and its pictorial representation is shown in Fig.4.B.5. and the energies of the HOMO-LUMO of the studied compounds are shown in Table 4.B.2.

Fig. 4.B.5. Pictorial representation of the HOMO-LUMO of selected compounds (DP-1 to DP-3)

From the Table 4.B.2., It is evident that the energy of HOMO and LUMO orbitals are negative and this shows that the compounds under study (DP1 to DP-3) are relatively stable ${ }^{45}$ and the energy of HOMO and LUMO orbitals of the compounds are -4.20 eV (DP-1), -4.31 eV (DP-2), -4.30 eV (DP-3) and -1.09 eV (DP-1), -1.36 eV (DP-2), -1.41 eV (DP-3) respectively. With the help of the energies of the HOMO and LUMO, global chemical descriptors like chemical potential, global hardness and global electrophilicity can be determined which is helpful for understanding the reactivity and the structure of the molecule which in turn is essential for determination of the various pharmacological properties of the molecule for the process of drug design ${ }^{46}$. The ionization energy (I) and electron affinity (A) can be expressed in terms of HOMO and LUMO orbital energies as follows

$$
\mathrm{I}=- \text { Eномо } \text { and } \mathrm{A}=-\mathrm{E}_{\text {LUмо }}
$$

The chemical reactivity descriptors such as chemical potential ( $\mu$ ), Electronegativity $(\chi)$, Global hardness $(\eta)$ and global electrophilicity power ( $\omega$ ) can be calculated with the help of following relation;

$$
\begin{gathered}
\text { Chemical potential }(\mu)=\left(\mathrm{E}_{\text {номо }}+\mathrm{E}_{\mathrm{LUMO}}\right) / 2=-(\mathrm{I}-\mathrm{A}) / 2 \\
\text { Electronegativity }(\chi)=(\mathrm{I}+\mathrm{A}) / 2 \\
\text { Global Hardness }(\eta)=\left(-\mathrm{E}_{\text {номо }}+\mathrm{E}_{\mathrm{LUMO}}\right) / 2=(\mathrm{I}-\mathrm{A}) / 2 \\
\text { Electrophilicity power }(\omega)=\mu^{2} / 2 \eta
\end{gathered}
$$

Where I and A are the first ionization potential and electron affinity of the chemical species ${ }^{47-49}$.

The ionization energy (I), electron affinity (A), Chemical potential ( $\mu$ ), Electronegativity $(\chi)$, Global hardness $(\eta)$ and Global electrophilicity power $(\omega)$ of the studied compounds (DP-1 to DP-3) are listed in Table 4.B.3.

Table. 4.B.2. Energies of HOMO and LUMO orbitals, ionization energy (I), electron affinity (A), Chemical potential ( $\mu$ ), Electronegativity ( $\chi$ ), Global hardness $(\eta)$ and Global electrophilicity power $(\omega)$ of the studied compounds (DP-1 to DP3)

| Parameters (eV) | DP-1 | DP-2 | DP-3 |
| :---: | :---: | :---: | :---: |
| ЕНомо | -4.20 | -4.31 | -4.30 |
| E LUMO $^{\Delta} \mathrm{E}$ | -1.09 | -1.36 | -1.41 |
| Ionization Energy (I) | 3.10 | 2.94 | 2.89 |
| Electron Affinity (A) | 1.09 | 4.31 | 4.30 |
| Chemical potential $(\mu)$ | -2.64 | -2.83 | -2.85 |
| Electronegativity $(\chi)$ | 2.64 | 2.83 | 2.85 |
| Global hardness $(\eta)$ | 1.55 | 1.47 | 1.44 |
| Electrophilicity power $(\omega)$ | 2.25 | 2.72 | 3.81 |

It is seen that the chemical potential of all the studied molecules are negative and this suggests that the compounds under investigation do not decompose spontaneously into its elements they are made up of.

Apparently, it is seen that the hard molecule has large HOMO-LUMO gap and soft molecule has small HOMO-LUMO gap ${ }^{50}$. Thus, from the Table 4.B.3, it is evident that the hardness of the studied molecule follows the order DP-1 $>$ DP-2 $>$ DP-3. Moreover, the hardness signifies the resistance towards the deformation of electron cloud of chemical systems under small perturbation that occur during the chemical reaction. Thus, hard system is less polarizable than soft system ${ }^{51}$. Again, a large value of electrophilicity is assigned for good electrophile whereas nucleophile is described by low value of nucleophilicity ${ }^{52}$.

## 4.B.2.1.3 FT-IR analysis

Study of the molecular vibrations of organic compounds is an important area of research as it is possible to correlate the theoretical and experimental FT-IR spectra of the studied compounds to figure out the different structural features in the molecules.

The theoretical vibrational spectra of the studied compounds (DP-1 to DP3) was calculated using B3LYP/ $631 \mathrm{G}+(\mathrm{d}, 2 \mathrm{p})$ basis set on the optimized geometry of the molecules in the gas phase. The experimental and theoretical vibrational

## Chapter-IV B

frequencies of the studied compounds (DP-1 to DP-3) are given in Table 4.B. 3 with proper assignment of the observed peaks.

## 4.B.2.1.3.1 C-H stretching vibration

For the studied compounds (DP-1 to DP-3), C-H functional group is present at various positions. The characteristic C-H stretching vibration of the aromatic ring falls in the range $3100-3000 \mathrm{~cm}^{-1} 53$. In the present investigation, theoretically calculated bands in the range of 3209-3162 $\mathrm{cm}^{-1}, 3223-3164 \mathrm{~cm}^{-1}$ and $3220-3163 \mathrm{~cm}^{-1}$ were assigned to aromatic $\mathrm{C}-\mathrm{H}$ stretching vibrations for the compounds DP-1, DP-2 and DP-3 respectively. Pure symmetric bands were calculated at $3209 \mathrm{~cm}^{-1}$ in DP-1, $3223 \mathrm{~cm}^{-1}$ in DP-2 and $3223 \mathrm{~cm}^{-1}$ in DP-3 respectively. Asymmetric vibrational bands were calculated with stretching frequencies $3195 \mathrm{~cm}^{-1}, 3183 \mathrm{~cm}^{-1}$ and $3162 \mathrm{~cm}^{-1}$ for DP-1, $3220 \mathrm{~cm}^{-1}, 3220 \mathrm{~cm}^{-1}$, $3164 \mathrm{~cm}^{-1}$ for DP-2 and $3220 \mathrm{~cm}^{-1}, 3163 \mathrm{~cm}^{-1}$ for DP-3 respectively. Because of the integration of several bands in the molecules, it is very difficult to detect the aromatic C-H stretching in this type of systems.

The characteristic C-H stretching vibration for aliphatic systems like the CH symmetric stretching vibration for $\mathrm{CH}_{3}$ group is found at $3006 \mathrm{~cm}^{-1}$ for DP-1, $3017 \mathrm{~cm}^{-1}$ for DP-2 and $3017 \mathrm{~cm}^{-1}$ for DP-3 respectively. The experimentally observed values for C -H symmetric stretching vibrations for $\mathrm{CH}_{3}$ group lies in the range $2988 \mathrm{~cm}^{-1}$ for DP-1, $3004 \mathrm{~cm}^{-1}$ for DP-2 and $2969 \mathrm{~cm}^{-1}$ for DP-3 respectively. Another important C -H stretching vibration found in BHPMs is the $\mathrm{C}-\mathrm{H}$ symmetric stretching vibration for $\mathrm{C}_{2} \mathrm{H}_{5}$ group. Theoretically, the $\mathrm{C}-\mathrm{H}$ symmetric stretching vibration for $\mathrm{C}_{2} \mathrm{H}_{5}$ group is found at $3045 \mathrm{~cm}^{-1}$ for DP-1, $3047 \mathrm{~cm}^{-1}$ for DP-2 and $3043 \mathrm{~cm}^{-1}$ for DP-3 respectively.

## 4.B.2.1.3.2 C-O stretching vibration

For the studied compounds, the $\mathrm{C}=\mathrm{O}$ stretching frequency is an important stretching vibration. The $\mathrm{C}=\mathrm{O}$ stretching vibration for the studied compounds were found at $1790.21 \mathrm{~cm}^{-1}$ for DP-1, $1790.76 \mathrm{~cm}^{-1}$ for DP-2 and $1791.55 \mathrm{~cm}^{-1}$ for DP-3 respectively. The experimental $\mathrm{C}=\mathrm{O}$ stretching vibration for these compounds were found at $1666 \mathrm{~cm}^{-1}$ for DP-1, $1667 \mathrm{~cm}^{-1}$ for DP-2 and $1635 \mathrm{~cm}^{-1}$ for DP-3.

## 4.B.2.1.3.3. $\mathrm{N}-\mathrm{H}$ stretching vibration

N-H stretching vibration is an important stretching vibration for the studied compounds (DP-1 to DP-3). For the compound DP-1, the theoretical N-H stretching vibration was found at $3639 \mathrm{~cm}^{-1}$, for DP-2 it was found at $3632 \mathrm{~cm}^{-1}$ and for DP-3 it was found at $3633 \mathrm{~cm}^{-1}$. The experimentally determined $\mathrm{N}-\mathrm{H}$ stretching vibration for DP-1 was assigned at $3009 \mathrm{~cm}^{-1}$, for DP-2 it was found at $3444 \mathrm{~cm}^{-1}$ and for DP-3 the N-H stretching vibration was found at $3455 \mathrm{~cm}^{-1}$ respectively.

## 4.B.2.1.3.4. Aromatic C-C stretching vibration

Generally, the bands observed in the range $1650-1400 \mathrm{~cm}^{-1}$ are assigned to C-C stretching mode of aromatic derivatives ${ }^{54}$. In our present study, the range for theoretically calculated C-C stretching vibrational mode showing sharp bands are in the range $1637-1555 \mathrm{~cm}^{-1}, 1622-1587 \mathrm{~cm}^{-1}$ and $1621-1586 \mathrm{~cm}^{-1}$ for DP-1, DP-2 and DP-3 respectively (Table 4.B.3). Experimentally, the aromatic C-C stretching frequencies for the studied compounds observed in the range $1629-1531 \mathrm{~cm}^{-1}$ in DP-1, $1625 \mathrm{~cm}^{-1}$ in DP-2, and $1474 \mathrm{~cm}^{-1}$ for DP-3 respectively.

Thus, from the above discussions, it is evident that the theoretically calculated vibrational frequency matched well with the experimental results for the studied compounds (Fig. 4.B.6).

## Chapter-IV B

Fig. 4.B.6. Theoretical and experimental FTIR spectra of DP-1 to DP-3

## 4. B.2.1.4 Molecular Electrostatic Potential (MEP)

In chemical systems, the electrostatic potential around molecules is an important parameter for assessing and correlating the molecular structure and their physicochemical properties ${ }^{55}$. Moreover, MEP helps in understanding the sites of electrophilic and nucleophilic reactions, along with hydrogen bonding interactions ${ }^{56}$. To analyze the reactive sites of electrophilic and nucleophilic attack for the compounds under study (DP-1 to DP-3), Molecular Electrostatic Potentials at B3LYP/631G+ (d, 2p) was calculated. The electrostatic potentials at the MEP surfaces are given by different colors like red, blue and green. Red, blue and green colour represents the region of most negative, most positive and zero electrostatic potential respectively. Thus, the electrostatic potential increases in the order blue $>$ green $>$ yellow $>$ orange $>$ red.The most negative electrostatic potential (red, orange and yellow region) in the MEP surface is assigned for the electrophilic reaction sites and the positive (blue) region corresponds to nucleophilic reaction site ${ }^{57-58}$. The MEP surface of the studied compounds (DP-1 to DP-3) is depicted in Fig.4.B.7. A detailed description of the MEP surface indicating the region of negative/ electrophilic reaction sites and positive/nucleophilic reaction site for the studied compounds (DP-1 to DP-3) are listed in Table 4.B.4.

## Chapter-IV B

## 4.B.2.1.2.5 NLO properties

Nonlinear optical phenomenon is generally caused by the interaction of materials with electromagnetic fields, resulting in altered wave numbers, phases, or other physical properties of the electromagnetic field ${ }^{59}$. Organic molecules having extended $\pi$ - conjugation with delocalized electrons and intra molecular charge transfer from donor to acceptor orbital through $\pi$-spacer generally show a rapid response to light and have strong NLO properties ${ }^{60}$. Organic molecules having good non-linear properties are widely used in the field of organic light emitting diodes, transistors and dye sensitized solar cells ${ }^{61}$

Theoretically, the NLO properties of the given compound is calculated by determining the parameters such as magnitude of dipole moment $(\mu)$, polarizability $(\alpha)$, anisotropy of polarizability $(\Delta \alpha)$, first hyperpolarizability $(\beta)$ and second order hyperpolarizability $(\gamma)$. The polarizability tensors are calculated using the following relations ${ }^{62}$

Dipole moment $\mu=\left(\mu x^{2}+\mu y^{2}+\mu z^{2}\right)^{1 / 2}$

$$
\begin{equation*}
\alpha(\text { total }) \text { or }\langle\alpha\rangle=\frac{1}{3}(\alpha x x+\alpha y y+\alpha z z) . \tag{2}
\end{equation*}
$$

$$
\begin{gathered}
\Delta \alpha=1 / \sqrt{ } 2\left[(\alpha x x-\alpha y y)^{2}+(\alpha y y-\alpha z z)^{2}+(\alpha z z-\alpha x x)^{2}+6\left(\alpha x y^{2}+\alpha x z^{2}+\alpha y z^{2}\right.\right. \\
)]^{1 / 2} \ldots \ldots . .(3)
\end{gathered}
$$

$$
\beta x=\beta x x x+\beta x y y+\beta x z z .
$$

$$
\beta y=\beta y y y+\beta y z z+\beta y x x .
$$

$$
\beta z=\beta z z z+\beta z x x+\beta y y z .
$$

$$
\begin{equation*}
\beta \text { total }=\left(\beta x^{2}+\beta y^{2}+\beta z^{2}\right)^{1 / 2} \tag{7}
\end{equation*}
$$

$<\gamma>$ or $\gamma$ total $=1 / 5(\gamma x x x x+\gamma y y y y+\gamma z z z z+2(\gamma x x y y+\gamma y y z z+$ $\gamma x x z z)$ ). $\qquad$ (8)

The nonlinear optical properties such as dipole moments, dipole polarizabilities, first- and second order hyperpolarizabilities of the studied compounds (DP-1 to DP-3) were calculated by B3LYP/ 6-31G $+(\mathrm{d}, 2 \mathrm{p}$ ) basis set and the computed results are listed in Table 4.B.5.

Table. 4.B.5. Computed Dipole moments, dipole polarizabilities and anisotropic Polarizabilities and first-order hyperpolarizabilitiues of compounds DP-1 to DP-3

| Dipole moments, dipole polarizabilities and anisotropic polarizabilities |  |  |  |  |

| $\boldsymbol{\beta t o t a l ~ x ~ 1 0} \mathbf{~ 3 0}$ | 1.045 | 0.927 | 2.094 | 0.13 |
| $(\mathbf{e s u})$ |  |  |  |  |

A comparative study of the dipole moment in the studied system indicates that they have different charge distributions for different directions. The theoretically calculated dipole moments of the studied compounds are 3.58D (DP1), 3.079D (DP-2), 2.721D (DP-3) respectively and the dipole moment follows the order DP-1 > DP-2 > DP-3.

The compounds DP-1, DP-2 and DP-3 have dipole moment value less than the dipole moment value of urea ( 4.06 D ) reference. Also, the total dipole polarizabilities value of the studied compounds along all three directions is listed in Table 4.B.5. From the Table 4.B.5, it is evident that the dipole polarizability of the studied compounds follows the order DP-3(-20.209 $\left.\times 10^{-24}\right)>$ DP-2(-19.266 $\times$ $\left.10^{-24}\right)>$ DP-1 $\left(-17.249 \times 10^{-24}\right)$.

The theoretically computed first-order hyperpolarizabilities and their individual components for the studied compounds (DP-1 to DP-3) are listed in Table 4.B.6. From the Table 4.B.5, it is evident that the first-order hyperpolarizability of the studied compounds are $1.045 \times 10^{-30} \mathrm{esu}, 0.927 \times 10^{-30}$ esu and $2.094 \times 10^{-30}$ esu for compounds DP-1, DP-2 and DP-3 respectively. A comparison of the first-order hyperpolarizability value of the studied compounds with the standard reference urea ( $0.13 \times 10^{-30} \mathrm{esu}$ ) have shown that the studied compounds have far greater value of first-order hyperpolarizability value than urea. Thus, the order for the first-order hyperpolarizability of the studied compounds are DP-3 > DP-1 > DP-2.

The second order hyperpolarizabilities of the compounds DP-1 to DP-3 are given in Table 4.B.6. The second order hyperpolarizability of the studied compounds are $-0.877 \times 10^{-36}$ esu, $-1.129 \times 10^{-36}$ esu and $-1.670 \times 10^{-36}$ esu for DP1 , DP-2 and DP-3 respectively.

Table. 4.B.6. Second order hyperpolarizabilities of studied compounds DP-1 to DP-3

## Second order hyperpolarizabilities

| Entry | $\gamma_{\text {xxx }}$ | $\gamma_{\text {yyy }}$ | $\gamma_{\text {zuzz }}$ | $\gamma_{\text {xxy }}$ | $\gamma_{\text {yyzz }}$ | $\gamma_{\text {xxzz }}$ | $\begin{gathered} \gamma_{\text {total }} \\ \left(\times 10^{-}\right. \\ \left.{ }^{36}\right) \text { esu } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| DP-1 | -3558.66 | -3133.59 | -635.75 | -86.88 | 174.92 | -779.3 | -0.87 |
| DP-2 | -5633.49 | -3064.38 | -191.64 | 443.58 | -680.33 | -924.5 | -1.12 |
| DP-3 | -6568.69 | -3064.22 | -201.93 | -1639.22 | -683.36 | -1050 | -1.67 |
| Urea | -120.66 | -117.90 | -29.39 | -44.02 | -28.01 | -39.86 | -0.04 |

The order of second-hyperpolarizability of the studied compounds is given by DP-3> DP-2> DP-1 and from the Table 4.B.6, it is evident that the second-order
hyperpolarizability of the studied compounds are much greater than the reference NLO material urea.

From the above discussion, it is evident that the studied molecule DP-1 to DP-3 have shown greater value of nonlinear optical parameters than the reference urea molecule and we may infer that this set of molecules could act as a better nonlinear optical material.

## 4.B.2.2 Molecular Docking Study

Type-2 diabetes mellitus is a condition where there is an elevation of glucose level in the blood (hyperglycemia) or an elevation in the insulin levels in the blood (hyperinsulinemia) ${ }^{63}$. Among various available therapies for type-2 diabetes mellitus, Sodium glucose co-transporter 2 (SGLT2) inhibitors are very popular class of drugs which is used to control hyperglycemia ${ }^{64}$

Molecular Docking studies now days have become an essential tool for drug design and provides helpful information about various interactions between the ligand and the protein in a faster and cost-effective way ${ }^{62,65}$. In this chapter, we have reported the molecular docking study of the selected 3,4 Dihydropyrimidine-$2-[1 \mathrm{H}]$-one derivatives against the protein 3DH4.
The protein 3DH4 structure has often been used in homology studies for the inhibition of sodium-dependent glucose transporters (SGLTs). The protein has an approximately $3.0 \AA$ structure that contains 14 transmembrane helices in an inward facing conformation with a core structure of inverted repeats of 5 TM helices (TM2 - TM6 and TM7 - TM11). Galactose can be found bound to the center of the core, kept in place away from the outside by hydrophobic residues.

## 4.B.2.2.1 Visualization of the Docking Result

Molecular docking study of the compounds (DP-1 to DP-3) against the protein 3DH4 has been carried out using GUI interface programme of Autodock Tools (MGL tool or Molecular Graphics Laboratory tool developed by Scripps research Institute ${ }^{66}$. The docking results have been visualized with the help of Biovia Discovery Studio 2020 (DS), version 21.1.0.20298 and Edu Pymol version 2.5.2.
After successful docking of the compounds (DP-1 to DP-3) with the protein 3DH4, the docking result showed different types of protein-ligand interactions with particular binding energies. For better understanding of fitting of the ligand into the binding pocket of the protein, ligands are shown as blue green stick. The hydrogen bonding interactions between ligands and protein are shown by green dash line, the $\pi$-sulfur interaction as yellow dash line, $\pi$-anion $/ \pi$-cation interactions as orange dash line, $\pi$-sigma interactions as purple dash line, $\pi-\pi$ stacking/ $\pi$ - $\pi$ T-shaped interactions as dark pink dash line and $\pi$-alkyl interactions as light pink dash line respectively. The binding energy ( $\Delta \mathrm{G}$ ) and the predicted inhibitory constant $\left(\mathrm{pK} \mathrm{K}_{\mathrm{i}}\right)$ of the studied compounds (DP-1 to DP-3) are found to be $-6.9 \mathrm{Kcal} / \mathrm{mole}(\mathrm{DP}-1)$, -
$7.9 \mathrm{Kcal} / \mathrm{mole}$ (DP-2), $-6.1 \mathrm{Kcal} / \mathrm{mole}$ (DP-3) respectively and $6.85 \mu \mathrm{M}, 1.23 \mu \mathrm{M}$, and $27.22 \mu \mathrm{M}$ respectively (Table 4.B.7)

Table. 4.B.7. Summary of docking of the compound (IM-1 to IM-6) against insulin receptor protein 1IR3 with corresponding binding energy $(\Delta \mathrm{G})$, predicted inhibitory constant $\left(\mathrm{pK}_{\mathrm{i}}\right)$, interacting amino acid residues and type of interactions.

| Ligands | Binding <br> Energy <br> $(\mathrm{kcal} / \mathrm{mol})$ | Predicted <br> inhibitory <br> constant <br> $\left(\mathbf{p} \mathbf{K i}^{\prime}\right) \mu \mathrm{M}$ | Amino Acid <br> residues | Types of interactions |
| :---: | :---: | :---: | :---: | :---: |
| DP-1 | -6.9 | 6.85 | Phe133, Tyr430, <br> Leu433, Ile464, <br> Val434 | $\pi-\pi$ T-shaped, <br> Alkyl, $\pi$ - Alkyl <br> $\pi$-Sigma |
| DP-2 | -7.9 | 1.23 | Phe479, Met244, <br> Met477, Lys471 | Conventional H- <br> bonding, <br> Unfavorable Acceptor- <br> Acceptor, |
|  |  |  |  | $\pi$-Donor Hydrogen <br> Bond, Carbon H-bond |

The visualization of the docking result of compound DP-1 with the protein 3DH4 showed that the ligand fits into a pocket region present in the outer regions of the protein surface (Fig. 4.B.7). A close analysis of the docking result revealed that the ligand interacts with the protein with binding energy $(\Delta \mathrm{G})$ value of -6.9 $\mathrm{Kcal} / \mathrm{mole}$ and predicted inhibitory constant ( $\left.\mathbf{p} \mathbf{K}_{\mathbf{i}}\right) 6.85 \mu \mathrm{M}$. The main interactions between the ligand DP1 and the protein were characterized by different interactions between $\pi$ - electron of the ligand and different amino acid residues. A $\pi-\pi$ T-shaped interaction is observed between the phenyl ring of the amino acid residue Phe 133 and the phenyl ring of the ligand DP-1 at a distance of $5.00 \AA$. A $\pi$ sigma interaction occurs between the sigma electron of isopropyl group of amino acid residue Val434 and $\pi$-electron of the phenyl ring of the ligand DP-1 at a distance $3.80 \AA$. In addition, there are three $\pi$-alkyl interactions also observed between the ligand DP-1 and the protein. The first and second $\pi$-alkyl interactions exist between the $\pi$-electron of the phenyl ring of ligand DP-1 and alkyl group of amino acid residue Ile 464 and Leu 433 at $5.09 \AA$ and $5.32 \AA$ respectively. The third $\pi$-alkyl interaction was observed between the $\mathrm{CH}_{3}$ (6) group of the ligand DP-1 and the $\pi$-electron of phenyl ring of amino acid residue Tyr430 at $4.72 \AA$.

Fig 4.B.8. Visualisation of docking results of ligand DP-1 within a receptor site in the protein 3DH4: (A) Optimal binding mode of the protein with DP-1 ligand (Ligand DP-1 shown as blue and green stick model). (B) Amino acid residues involved in different interactions (purple dash lines show $\pi$-sigma interactions, dark pink lines show $\pi-\pi$ T-shaped interaction, and light pink dash lines show alkyl and $\pi$-alkyl interactions). (C) 2D representation of binding interaction of ligand DP-1 with different amino acid residues of the protein 3DH4.

Visualization of the docking results of the ligand DP-2 with the protein receptor 3DH4 revealed that the ligand fits into a pocket region present in the core region of the protein with the highest binding energy $(\Delta G)$ value of $-7.9 \mathrm{kcal} / \mathrm{mol}$ and the predicted inhibitory constant $\left(\mathrm{pK}_{\mathrm{i}}\right)$ value of $1.23 \mu \mathrm{M}$. The major interactions between the ligand DP-2 and the protein receptor are characterized by four major conventional hydrogen bonding. These hydrogen bonding are i) between $\mathrm{C}=\mathrm{O}$ group of the amino residue Glu68 and the -NH group of the ligand DP-2 at a distance of $2.37 \AA$, ii) between the $-\mathrm{NH}_{2}$ group present in the amino acid Gln68 and the $\mathrm{C}=\mathrm{O}$ group of the of the DHPM nucleus of the ligand at a distance of $2.46 \AA$, iii) between the $-\mathrm{NH}_{2}$ group of the amino acid Asn142 and the carbonyl oxygen atom of the -COOEt group present on the DHPM nucleus at a distance of
$2.80 \AA$, and iv) between the $-\mathrm{NH}_{2}$ group of the residue Asn267 and the ethereal oxygen of the -COOEt group present on the DHPM nucleus at a distance of $2.95 \AA$ respectively (Fig.4.B.8). $\Pi$-alkyl interaction was observed between the phenyl ring of the amino acid residue Leu137 and the methyl group (6) of the DHPM nucleus at a distance of $4.57 \AA$. A halogen induced interaction between the $\mathrm{C}=\mathrm{O}$ group of the residue Tyr263 and the Cl atom of the ligand DP-2 was observed at a distance of $3.15 \AA$.

Fig. 4.B.9. Visualisation of docking results of ligand DP-2 with receptor protein 3DH4: (A) Optimal binding mode of the protein with DP-2 ligand (Ligand DP-2 shown as blue and green stick model). (B) Amino acid residues involved in different interactions (green dash lines show conventional hydrogen bonding interactions, light blue dash lines show halogen induced interactions, and light pink dash lines show alky and $\pi$-alkyl interactions). (C) 2D representation of binding interaction of ligand DP-2 with different amino acid residues of the protein 3DH4.

Analysis of the docking results of the ligand DP-3 with the protein receptor 3DH4 showed high interaction affinity whereby the ligand fits into a pocket region of the protein present in the outer regions of protein with a binding energy $(\Delta \mathrm{G})$ value of $-6.1 \mathrm{kcal} /$ mole and predicted inhibitory constant $\left(\mathrm{pK}_{\mathrm{i}}\right)$ of $27.22 \mu \mathrm{M}$. The main interactions between the ligand DP-3 and the protein have been characterized
by two conventional hydrogen bonding between the - NH group of the residue Phe479 and the carbonyl group of the DHPM nucleus of the ligand at a distance of $2.21 \AA$, and between the $\mathrm{C}=\mathrm{O}$ group of the residue Met 477 and the NH group of the ligand DP-3 at a distance of $2.25 \AA$ respectively (Fig.4.B.9). Two unfavorable acceptor-acceptor interaction was encountered between the $\mathrm{C}=\mathrm{O}$ group of the residue Met244 and the carbonyl group of the ligand DP-3 at a distance of $3.00 \AA$ and between the $\mathrm{C}=\mathrm{O}$ group of the residue Lys 471 with the oxygen atom present in the phenyl ring of the ligand DP-3 at a distance of $2.89 \AA$. In addition, a $\pi$-donor hydrogen bonding interaction was also observed between the -NH group of the residue Met477 and the $\pi$-electron of phenyl ring of the ligand DP-3 at a distance of $2.99 \AA$.

Fig. 4.B.10. Visualisation of docking results of ligand DP-3 within a receptor site in the protein 3DH4: (A) Optimal binding mode of the protein with DP-3 ligand (Ligand DP-3 shown as blue and green stick model). (B) Amino acid residues involved in different interactions (green dash lines show conventional hydrogen bonding interactions, light green dash lines depict carbon hydrogen bonding and $\pi$ donor hydrogen bonding interactions, and red dash lines show unfavourable acceptor-acceptor interactions). (C) 2D representation of binding interaction of ligand DP-3 with different amino acid residues of the protein 3DH4.

## 4.B.2.3 In silico Pharmacokinetic analysis of DP-1 to DP-3

The pharmacokinetic properties like absorption, distribution, metabolism, excretion and toxicity (ADMET) are fundamental properties in determining the drug likeness of any compounds prior to its clinical and animal studies. Therefore, ADMET property of the studied compounds plays an important role in categorizing them as a drug candidate as well as their activity inside the body ${ }^{67}$. The ADMET parameters provide useful information about the concentrations of the drug in the different parts of the body with respect to time ${ }^{68}$. ADMET properties such as gastrointestinal absorption (GI), water solule capability (Log s), lipophilicity (Log Po/W), CYP1A2 inhibitor and Blood-Brain Barrier (BBB) are fundamentally important for any studied compounds to be considered them as a drug candidate ${ }^{69}$. Therefore, the pharmacokinetic properties of the selected $2,4,5$ triarylimidazole derivatives (IM-1 to IM-6) have been computed with the help of computer aided online SwissADME database (http://www.swissadme.ch) and the result of the pharmacokinetic properties along with the Lipinski's property are listed in Table 4.B. 8

From the table it is evident that all the studied compounds (DP-1 to DP-3) with bioavailability score in the range of $55 \%$ have lipophilicity value ( $\log \mathrm{P}_{\mathrm{o}} / \mathrm{W}$ ) in the range 1.14-1.79 and has good gastrointestinal absorption. The high and positive value of lipophilicity ( $\operatorname{LogPo} / \mathrm{w}$ ) for the studied compounds indicated that the compounds are more lipophilic and these compounds could easily pass through the lipid bilayer of most cellular membrane. From the solubility (Log S) values of the studied compounds which falls in the range of -2.15 to -3.07 it can be said that all the studied compounds are soluble in water. However, the studied compounds do not have any BBB and CYP1A2 properties. It can also be clearly seen that all these compounds have no violations of Lipinski's rule and can be qualified as a potential candidate for a drug.

Table. 4.B.8. Lipinski's properties and pharmacokinetic properties (ADME) of studied compounds DP-1 to DP-3

|  | COMPOUNDS |  | DP-3 |

## 4. B.2.4 Computational details

## 4.B.2.4.1 DFT study

All Quantum Mechanical calculations were carried out on a hp-Z640 desktop P.C. with an Intel Xeon processor (Specifications: E5-2630 V4 @ 220 GHz ) using Gaussian 16 W package. Density functional theory (DFT) with Becke's (B)three parameter hybrid model, Lee, Yang and Parr's (LYP) using $631 \mathrm{G}+(\mathrm{d}, 2 \mathrm{p})$ basis set has been employed to optimize the geometry of the $3,4-$ dihydropyrimidin-(2H)-one derivatives (DP-1 to DP-3).

A set of theoretical calculations of selected compounds (DP-1 to DP-3) were performed with Gaussian 16W, Revision A. 03 programme package using B3LYP/631G+(d,2p) basis sets to optimize geometry and minimize energy for faster and accurate calculations. With the optimized geometry, theoretical Raman and IR spectra were also calculated from the so chosen basis set. From the optimized geometry, the energy of HOMO and LUMO molecular orbitals along with the energy of HOMO-LUMO gap has also been measured. For analyzing the result of the theoretical calculations, a visual representation was obtained by Gauss View program6 and it has been used to construct the molecular electrostatic
potential surface (MESP) as well as the shape of HOMO and LUMO molecular orbitals. Also, nonlinear Optical property (NLO) of the selected 3,4-dihydropyrimidin-( 2 H )-one derivatives have also been calculated taking urea as a reference NLO material.

## 4.B.2.4.2 Preparation of Protein and ligand for docking Study

The X-ray crystallographic structures of phosphorylated insulin receptor tyrosine kinase protein (PDB 3DH4) has been downloaded from the Protein Data Bank (PDB) (http: //www.pdb.org.) database. Graphical User Interface program "Auto Dock Tools (ADT) 1.5.6" from Molecular Graphics Laboratory (MGL) developed by Scripps Research Institute has been used for the preparation of protein for docking study ${ }^{66}$. Input file of receptor protein for the blind docking study were created by taking specific chain (Chain A) of the protein (3DH4). In a typical receptor protein preparation, water molecules and hetero atoms along with the cocrystallized ligands in PDB crystal structure was removed and subsequently, the receptor. pdbqt file has been prepared by adding polar hydrogen atoms and Kollman united atom charges ${ }^{62,65}$. The three-dimensional (3D) structures of ligands (DP-1 to DP-3) were drawn using Chemsketch (ACD/Structure Elucidator, version 12.01, Advanced Chemistry Development, Inc., Toronto, Canada, 2014, http://www.acdlabs .com.) and geometry optimization of the ligands (DP-1 to DP3) were carried out using MM2 program incorporated in Chem. Draw Ultra 8.0 and further optimization of geometry of each molecule were carried out with the MOPAC 6 package using the semi-empirical AM1 Hamiltonian ${ }^{70}$. The input .pdbqt file of the ligands was generated using Auto Dock Tools (ADT). As the ligand molecules (DP-1 to DP-3) were non peptides, therefore, Gasteiger charge was assigned and then non-polar hydrogen was merged.

## 4.B.2.4.3 Molecular docking study using Autodock vina

All molecular docking calculations of the studied ligands (DP-1 to DP-3) with protein 3DH4 were carried out in the AutoDock Vina programe 1.1.2 developed by Scripps Research institute ${ }^{71-72}$ and the results of the docking study and the intermolecular interactions between receptors protein and the ligand molecules were analyzed using BIOVIA Discovery Studio 2020 (DS), version 20.1.0.0 (Dassault Systèmes BIOVIA, Discovery Studio Modeling Environment, Release 2017, San Diego: Dassault Systèmes, 2016) and Edu pymol version 1.7.4.4 ${ }^{72}$. The three-dimensional (3D) affinity (grid) maps and electrostatic a grid boxes of $80 \times 80 \times 80 \AA$ grid points and grid centre ( $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ ) of 28.108, -43.008 , 59.313 with a spacing of $1.00 \AA$ generated by AutoGrid auxiliary program for each of the receptor protein for blind docking were generated to cover the entire active site of the receptor protein in order to eliminate biasness arising during the docking simulation ${ }^{73}$. Lamarckian genetic algorithm and a standard protocol with default setting of other run parameters were used for docking simulation. For each docking experiments, several runs were performed by the program with one predicted binding mode with each run. All the torsions were allowed to rotate. The predicted

## Chapter-IV B

inhibitory constant ( $\mathbf{p} \mathbf{K}_{\mathbf{i}}$ ) has been calculated using the following standardized equation ${ }^{74}$

$$
\mathrm{pK}_{\mathrm{i}}=10^{\frac{\text { Binding Energy Score }}{1.336}}
$$

## 4.B.2.4.4 Pharmacokinetic study

The pharmacokinetic properties like like absorption, distribution, metabolism, excretion and toxicity (ADMET) of the compounds (IM-1 to IM-6) have been studied using the computer aided online SwissADME database (http://www.swissadme.ch)
