

Preface

Immanuel Kant was a great philosopher of the 18th century and continues to influence current discussion in most branches of philosophy. In his time, he focused his study on the foundational aspects of science including that of physics. I find his transcendental philosophy to be significant in the philosophical understanding of physics. In this thesis, I have explained the significance of Kant in the sphere of philosophy of physics by chiefly dealing with his concepts of *a priori*, categories, principles, space and time, and the laws that he formulated.

I express my profound sense of gratitude and heartfelt thanks to my supervisor, Dr. Anirban Mukherjee, Associate Professor, Department of Philosophy, North Bengal University for his valuable guidance and constant encouragement while writing this thesis. It could not have been possible without his inexhaustible inspiration and supervision.

I thank Dr. George Thadathil (The Principal of Salesian College, Siliguri) who helped me to get the library membership of Salesian College, Sonada.

I am obliged to the family members of Dr. Moti Bir Rai (former Reader in the Department of Philosophy of Darjeeling Government College) who provided me with some relevant books which I needed most.

My obligations to previous writers on Kant and philosophy of science are many, and I have acknowledged their works as far as possible in the proper places. I thank all of them.

I am also indebted to the Head and all the faculty members of the Department of Philosophy of North Bengal University for their motivation and guidance.

I thank my family for their love and encouragement, and especially my parents, who raised me with a love for education.

Eagam Khaling
