## DECLARATION

I hereby declare that the thesis entitled “**Biological evaluation of indigenous medicinal plants from Darjeeling Himalayan region of West Bengal for natural compound(s) as inhibitor of cancer cell proliferation and studies on their molecular mechanism**” is a genuine research work carried out by me in the Department of Biotechnology, University of North Bengal, Darjeeling- 734013, West Bengal, India, under the supervision of **Prof. (Dr.) Shilpi Ghosh** and Co-supervision of **Dr. Anoop Kumar**, Department of Biotechnology, University of North Bengal, Darjeeling- 734013, West Bengal, India. I also affirm that the thesis is the original work and has not been submitted before in part or full for any degree, diploma or any other academic award to this or any other University or Institution.

Place: NBU

Date: 08/09/2023

## CERTIFICATE

This is to certify that Mrs. Vijeta Rai has carried out her research work under our joint supervision with Dr. Anoop Kumar, Advanced Nanoscale Molecular Oncology Laboratory, Department of Biotechnology, NBU. Her thesis entitled "**Biological evaluation of indigenous medicinal plants from Darjeeling Himalayan region of West Bengal for natural compound(s) as inhibitor of cancer cell proliferation and studies on their molecular mechanism**" is based on her original work and is being submitted for the award of Ph.D. degree in Biotechnology in accordance with the rules and regulations of the University of North Bengal. No part of this thesis has formed the basis for the award of any degree or fellowship previously.

Date: 8/9/2023

Biological evaluation of indigenous medicinal plants from Darjeeling Himalayan region of West Bengal for natural compound(s) as inhibitor of cancer cell proliferation and studies on their molecular mechanism A Thesis submitted to the University of North Bengal For the Award of Doctor of Philosophy in Biotechnology By Vijeta Rai Under the supervision of Prof. (Dr.) Shilpi Ghosh Co – Supervision of Dr. Anoop Kumar DEPARTMENT OF BIOTECHNOLOGY UNIVERSITY OF NORTH BENGAL September, 2023

1 Chapter 1 General Introduction and review

2 Chapter 1 General introduction 1.1. General Introduction Natural products have played a significant role in drug development over the past century, with many drugs derived from natural sources. In fact, approximately 50% of the drugs approved by the U.S. Food and Drug Administration (FDA) between 1981 and 2010 were either natural products or derivatives of natural products (Majolo et al., 2019). Natural products are compounds that are produced by living organisms, including plants, animals, fungi, and microorganisms. These compounds have evolved over millions of years to perform specific functions in their native organisms, such as defense against predators or competition for resources (Zhang et al., 2005). The diversity of natural products is vast, and they offer a vast array of chemical structures and biological activities that can be harnessed for drug discovery. For example, alkaloids such as morphine and quinine are derived from plants and have been used for centuries to treat pain and malaria, respectively (Wase et al., 2008; Chopra et al., 2021). More recently, the anti-cancer drug paclitaxel was derived from the Pacific yew tree, and the anti-malarial drug artemisinin was isolated from the sweet wormwood plant. Natural products offer several advantages for drug development. They often have unique chemical structures and complex molecular frameworks that are difficult to synthesize, making them valuable starting points for drug discovery (Li et al., 2017; Grygorenko et al., 2020). They also have a proven track record of safety, as many of these compounds have been used in traditional medicine for centuries. Moreover, natural products offer a vast reservoir of novel chemical structures and biological activities that can be explored for drug discovery. With the increasing availability of genomic and metagenomic data, scientists are discovering new natural products from previously unexplored sources, such as plants, marine microbes and soil bacteria (Mishsteyn et al., 2014). Ethnomedicine is the study of traditional knowledge and practices related to the use of plants and other natural resources for healing purposes. It involves the use of plants, animals, minerals, and other natural substances in the prevention and treatment of diseases. Ethnomedicinal plants play a crucial role in the search for new natural products with pharmacological properties (Sheng et al., 2001; Mustafa et al., 2017). Many traditional medicines are derived from plant-based sources, and a significant number of modern drugs have their origins in natural products. Ethnobotanical studies have identified numerous plants with medicinal properties, including anti-inflammatory, antimicrobial, anticancer, antidiabetic, and antihypertensive properties, among others. These plants have been used in traditional medicine systems for centuries and are still used today in many parts of the world. The use of ethnomedicinal plants is an important source of new natural products for

## ACKNOWLEDGEMENTS

I would like to express my deepest gratitude and appreciation to the following individuals and institutions who have played a significant role in the completion of this thesis and my research work:

First and foremost, I am immensely grateful to my mentor-supervisor, Dr. Shilpi Ghosh, Professor, Department of Biotechnology, and University of North Bengal. I feel myself very lucky to have her as my mentor, she had shown tremendous belief on me and allowed me to choose the topic of my interest. She was always standing there for me to troubleshoot my problems during the research journey. Her valuable guidance, expertise, and unwavering support throughout this research journey have been invaluable. Her insightful feedback and constructive criticism have greatly contributed to shaping this thesis.

I am also deeply indebted to my Co-supervisor, Dr. Anoop Kumar, Assistant Professor, Department of Biotechnology, and University of North Bengal for his unwavering guidance and mentorship. I am very much thankful for him as he allowed me to do research in his laboratory and provide me all the guidance on the topic his expertise on this field. His knowledge, patience, and constructive feedback have been instrumental in shaping this thesis. I am truly grateful for his dedication and support.

I would also like to thank the Head of the Department, Dr. Ranadhir Chakraborty, Professor, Department of Biotechnology, and University of North Bengal for his inspiring lectures, stimulating discussions, and for creating a conducive academic environment. The knowledge and skills I have gained from his teachings have been instrumental in the successful completion of this work.

I am also deeply indebted to the faculty members of the Department, Dr. Dipanwita Saha, Professor and Dr. Manab Deb Adhikary, Assistant Professor, Department of Biotechnology, and University of North Bengal for their teachings and insights that have broadened my understanding of the subject matter. Their passion for knowledge and commitment to excellence has inspired me to strive for academic excellence.

I would like to extend my appreciation to the non-teaching staff of the department, whose assistance and resources have greatly facilitated my research. Their professionalism and willingness to assist have made my study more enriching and efficient.

Furthermore, I am grateful to my friends and labmates Ms. Khusboo Lepcha and Dr. Deepika Mazumdar for their camaraderie and stimulating discussions. Their intellectual exchanges and moral support have been a constant source of motivation during the challenging times.

I extend my sincere appreciation to my colleagues and friends Preeti Mangar, Smriti Pradhan, Ankita Dutta, Ayan Mahanty, Arijita Basak, Taniya Dey, Pooja BK, Satarupa, Subhasmita Chadra, Vaskar Das, Sudeb Sarkar, Vivek Kumar Ranjan, Divya limbo, Nitya Rai, Partha Barman, Chandana Basak who have provided me with continuous

encouragement and support with willingness to lend a helping hand have been immensely beneficial.

I would like to acknowledge Council of Scientific and Industrial Research (CSIR) for the financial support. Their funding allowed me to conduct the necessary experiments, analyze data, and present my findings at conferences. This support has been instrumental in the completion of this thesis.

Further, I would like to acknowledge Dr. Amitava Mondal, Assistant Professor, Department of Chemistry, Raiganj University, Dr. Shyama Prasad Saha, Department of Microbiology, and University of North Bengal, Dr. Nishika Jaishee, Department of Botany, Burdwan University and SAIF, IIT Madras for spectrometric and data analysis. Their valuable guidance and suggestion play significant role for the completion of this thesis.

To my mother (Lt. Smt Buddhi Maya Rai) and father (Lt. Shri Shiva Kumar Rai) who are somewhere in heaven, there are no words that could capture the gratitude I have for the sacrifices and dreams they have made for me. Their countless sacrifices made me the person who I am today, without them I would not have reached where I am stand today but unfortunately, I lost both during my research journey.

Furthermore, I would like to extent my heartfelt thanks to my family especially my husband (Mr. Arjun Rai). His constant love, support and motivation were my hidden strength during the harsh times. I equally appreciate my siblings Sunita Rai, Rajiv Rai and Martha Gurung who offered invaluable support and love which sustain me to move forward to achieve my goal. I am also very much thankful to my children, elder son (Arpan Rai) and younger son (Arhaan Rai), for made me stronger, better, and more fulfilled than I could have ever imagined.

I would like to thank God Almighty for giving me the opportunity and guidance to achieving my goal. The strength, wisdom, and knowledge that he showered on me help me to be successful in this part.

Lastly, if my research helps a single human or in the field of science or research community, even 0.00001% I would not consider my birth was a waste as a human being and I will thank myself too.

## PREFACE

The discovery of novel therapeutic agents from natural sources has always been an area of great interest in the field of medicinal research. Indigenous medicinal plants have been an integral part of traditional medicine systems, offering a vast repertoire of bioactive compounds with potential therapeutic properties. In recent years, there has been a growing interest in exploring the diverse flora of the Darjeeling Himalayan region of West Bengal, India, for the identification of natural compounds that could inhibit cancer cell proliferation.

Cancer remains a major global health concern, with a high mortality rate and limited treatment options for certain types of malignancies. Conventional cancer therapies often come with significant side effects and limited efficacy, prompting researchers to explore alternative approaches. Natural compounds derived from medicinal plants have shown promise as potential sources of anticancer agents due to their diverse chemical structures and biological activities.

The Darjeeling Himalayan region is characterized by its unique biodiversity, comprising of a wide array of plant species with medicinal properties. These plants have been traditionally used by local communities for various health-related purposes, including the treatment of cancer. However, the scientific validation of their efficacy and elucidation of their underlying molecular mechanism is essential for their integration into mainstream medicine. Therefore, research work presented herein aimed to evaluate the biological activity of indigenous medicinal plants from the Darjeeling Himalayan region, focusing on their potential as inhibitors of cancer cell proliferation. The study involved the collection and identification of plant samples, followed by their screening for phytochemicals, and antimicrobial and antioxidant activities, and cytotoxicity to cancer cells. A cytotoxic compound with steroidal skeleton was purified and characterized from *A. rivularis* rhizome and its mode of action on cancer cells was studied through in vitro inhibition of DNA synthesis enzyme, morphological analysis, and apoptotic gene expression analysis. The findings of this study have the potential to contribute to the development of novel therapeutic strategies for cancer treatment, utilizing the rich medicinal plant resources of the Darjeeling Himalayan region. The identification of bioactive compounds with potent anticancer properties and a better understanding of their molecular mechanisms will not only validate the traditional use of these plants but also offer new avenues for drug discovery and personalized medicine.
